1 The docstrip modules

The following modules are used in the implementation to direct docstrip in generating the external files:

- article produce the documentclass article
- report produce the documentclass report
- size10 produce the class option for 10pt
- size11 produce the class option for 11pt
- size12 produce the class option for 12pt
- book produce the documentclass book
- bk10 produce the book class option for 10pt
- bk11 produce the book class option for 11pt
- bk12 produce the book class option for 12pt
- driver produce a documentation driver file

2 Initial Code

In this part we define a few commands that are used later on.

\@ptsize This control sequence is used to store the second digit of the pointsize we are typesetting in. So, normally, it’s value is one of 0, 1 or 2.

1 \(\text{|article| report | book}\)
2 \(\text{\newcommand\@ptsize{}}\)

\if@restonecol When the document has to be printed in two columns, we sometimes have to temporarily switch to one column. This switch is used to remember to switch back.

3 \(\text{\newif\if@restonecol}\)

\@titlepage A switch to indicate if a titlepage has to be produced. For the article document class the default is not to make a separate titlepage.

4 \(\text{\newif\if@titlepage}\)
5 \(\text{\ifarticle\@titlepagefalse}\)
6 \(\text{\ifarticle\@titlepagetrue}\)

\@openright A switch to indicate if chapters must start on a right-hand page. The default for the report class is no; for the book class it’s yes.

7 \(\text{\ifarticle\newif\if@openright}\)

\ifmainmatter The switch \ifmainmatter, only available in the document class book, indicates whether we are processing the main material in the book.

8 \(\text{\ifbook\newif\ifmainmatter \@mainmattertrue}\)
3 Declaration of Options

3.1 Setting Paper Sizes

The variables \texttt{\paperwidth} and \texttt{\paperheight} should reflect the physical paper size after trimming. For desk printer output this is usually the real paper size since there is no post-processing. Classes for real book production will probably add other paper sizes and additionally the production of crop marks for trimming. In compatibility mode, these (and some of the subsequent) options are disabled, as they were not present in LaTeX2.09.

\begin{verbatim}
\if@compatibility\else
  \DeclareOption{a4paper}
  {\setlength\paperheight {297mm} %
   \setlength\paperwidth {210mm}}
\fi
\DeclareOption{a5paper}
  {\setlength\paperheight {210mm} %
   \setlength\paperwidth {148mm}}
\DeclareOption{b5paper}
  {\setlength\paperheight {250mm} %
   \setlength\paperwidth {176mm}}
\DeclareOption{letterpaper}
  {\setlength\paperheight {11in} %
   \setlength\paperwidth {8.5in}}
\DeclareOption{legalpaper}
  {\setlength\paperheight {14in} %
   \setlength\paperwidth {8.5in}}
\DeclareOption{executivepaper}
  {\setlength\paperheight {10.5in} %
   \setlength\paperwidth {7.25in}}
\DeclareOption{landscape}
  {\setlength\@tempdima \paperheight %
   \setlength\paperheight \paperwidth %
   \setlength\paperwidth \@tempdima}
\fi

The option \texttt{landscape} switches the values of \texttt{\paperheight} and \texttt{\paperwidth}, assuming the dimensions were given for portrait paper.

\begin{verbatim}
\if@compatibility
  \renewcommand\@ptsize{0}
\else
  \DeclareOption{10pt}{\renewcommand\@ptsize{0}}
  \DeclareOption{11pt}{\renewcommand\@ptsize{1}}
  \DeclareOption{12pt}{\renewcommand\@ptsize{2}}
\fi
\end{verbatim}

3.2 Choosing the type size

The type size options are handled by defining \texttt{\@ptsize} to contain the last digit of the size in question and branching on \texttt{ifcase} statements. This is done for historical reasons to stay compatible with other packages that use the \texttt{\@ptsize} variable to select special actions. It makes the declarations of size options less than 10pt difficult, although one can probably use 9 and 8 assuming that a class won't define both 8pt and 10pt options.

\begin{verbatim}
\if@compatibility
  \renewcommand\@ptsize{0}
\else
  \DeclareOption{10pt}{\renewcommand\@ptsize{0}}
  \DeclareOption{11pt}{\renewcommand\@ptsize{1}}
  \DeclareOption{12pt}{\renewcommand\@ptsize{2}}
\fi
\end{verbatim}
3.3 Two-side or one-side printing

For two-sided printing we use the switch `\if@twoside`. In addition we have to set the `\if@mparswitch` to get any margin paragraphs into the outside margin.

\[
\begin{align*}
40 & \text{\textbackslash if@compatibility\textbackslash else} \\
41 & \text{\textbackslash DeclareOption\{oneside\}\{\@twosidefalse \@mparswitchfalse\}} \\
42 & \text{\textbackslash fi} \\
43 & \text{\textbackslash DeclareOption\{twoside\}\{\@twosidetrue \@mparswitchtrue\}}
\end{align*}
\]

3.4 Draft option

If the user requests draft we show any overfull boxes. We could probably add some more interesting stuff to this option.

\[
\begin{align*}
44 & \text{\textbackslash DeclareOption\{draft\}\{\setlength\overfullrule\{5pt\}\}} \\
45 & \text{\textbackslash if@compatibility\textbackslash else} \\
46 & \text{\textbackslash DeclareOption\{final\}\{\setlength\overfullrule\{0pt\}\}} \\
47 & \text{\textbackslash fi}
\end{align*}
\]

3.5 Titlepage option

An article usually has no separate titlepage, but the user can request one.

\[
\begin{align*}
48 & \text{\textbackslash DeclareOption\{titlepage\}\{\@titlepagetrue\}} \\
49 & \text{\textbackslash if@compatibility\textbackslash else} \\
50 & \text{\textbackslash DeclareOption\{notitlepage\}\{\@titlepagefalse\}} \\
51 & \text{\textbackslash fi}
\end{align*}
\]

3.6 openright option

This option determines whether or not a chapter must start on a right-hand page request one.

\[
\begin{align*}
52 & \text{\textbackslash if\textbackslash if@compatibility} \\
53 & \text{\textbackslash book\{\openrighttrue\}} \\
54 & \text{\textbackslash if\textbackslash else} \\
55 & \text{\textbackslash if\textbackslash DeclareOption\{openright\}\{\openrighttrue\}} \\
56 & \text{\textbackslash if\textbackslash DeclareOption\{openany\}\{\openrightfalse\}} \\
57 & \text{\textbackslash if\textbackslash fi}
\end{align*}
\]

3.7 Two-column printing

Two-column and one-column printing is again realized via a switch.

\[
\begin{align*}
58 & \text{\textbackslash if@compatibility\textbackslash else} \\
59 & \text{\textbackslash DeclareOption\{onecolumn\}\{\@twocolumnfalse\}} \\
60 & \text{\textbackslash fi} \\
61 & \text{\textbackslash DeclareOption\{twocolumn\}\{\@twocolumntrue\}}
\end{align*}
\]

3.8 Equation numbering on the left

The option `leqno` can be used to get the equation numbers on the left side of the equation. It loads code which is generated automatically from the kernel files when the format is built. If the equation number does get a special formatting
then instead of using the kernel file the class would need to provide the code explicitly.

\DeclareOption{leqno}{\input{leqno.clo}}

3.9 Flush left displays

The option fleqn redefines the displayed math environments in such a way that they come out flush left, with an indentation of \mathindent from the prevailing left margin. It loads code which is generated automatically from the kernel files when the format is built.

\DeclareOption{fleqn}{\input{fleqn.clo}}

3.10 Open bibliography

The option openbib produces the “open” bibliography style, in which each block starts on a new line, and succeeding lines in a block are indented by \bibindent.

\DeclareOption{openbib}{%
First some hook into the bibliography environment is filled.
\AtEndOfClass{%
\renewcommand{\openbib@code{%
\advance\leftmargin\bibindent
\itemindent -\bibindent
\listparindent \itemindent
\parsep \z@}
}

In addition the definition of \newblock is overwritten.
\renewcommand{\newblock{\par}}%
}

4 Executing Options

Here we execute the default options to initialize certain variables. Note that the document class ‘book’ always uses two sided printing.

\ExecuteOptions{letterpaper,10pt,oneside,onecolumn,final}
\ExecuteOptions{letterpaper,10pt,oneside,onecolumn,final,openany}
\ExecuteOptions{letterpaper,10pt,twoside,onecolumn,final,openright}

The \ProcessOptions command causes the execution of the code for every option FOO which is declared and for which the user typed the FOO option in his \documentclass command. For every option BAR he typed, which is not declared, the option is assumed to be a global option. All options will be passed as document options to any \usepackage command in the document preamble.

\ProcessOptions
Now that all the options have been executed we can load the chosen class option file that contains all size dependent code.

\begin{verbatim}
84 \input{size1@ptsize.clo}
85 \input{bk1@ptsize.clo}
86 \input{article/report/book}
\end{verbatim}

5 Loading Packages
The standard class files do not load additional packages.

6 Document Layout
In this section we are finally dealing with the nasty typographical details.

6.1 Fonts
\LaTeX{} offers the user commands to change the size of the font, relative to the ‘main’ size. Each relative size changing command \texttt{\textbackslash size} executes the command \texttt{\@setfontsize\textbackslash size\langle font-size\rangle\langle baselineskip\rangle} where:

\begin{itemize}
  \item \texttt{\langle font-size\rangle} The absolute size of the font to use from now on.
  \item \texttt{\langle baselineskip\rangle} The normal value of \texttt{\baselineskip} for the size of the font selected. (The actual value will be \texttt{\baselinestretch \* \langle baselineskip\rangle}.)
\end{itemize}

A number of commands, defined in the \LaTeX{} kernel, shorten the following definitions and are used throughout. They are:

\begin{verbatim}
\@vpt 5 \@vipt 6 \@viipt 7
\@viiipt 8 \@ixpt 9 \@xpt 10
\@xipt 10.95 \@xiipt 12 \@xivpt 14.4
\end{verbatim}

\texttt{\normalsize} The user level command for the main size is \texttt{\normalsize}. Internally \LaTeX{} uses \texttt{\@normalsize} when it refers to the main size. \texttt{\@normalsize} will be defined to work like \texttt{\normalsize} if the latter is redefined from its default definition (that just issues an error message). Otherwise \texttt{\@normalsize} simply selects a 10pt/12pt size.

The \texttt{\normalsize} macro also sets new values for \texttt{\abovedisplayskip}, \texttt{\abovedisplayshortskip} and \texttt{\belowdisplayshortskip}.

\begin{verbatim}
87 (*10pt | 11pt | 12pt)
88 \renewcommand\normalsize\%
89 (*10pt)
90 \@setfontsize\normalsize\xipt\xiiipt
91 \abovedisplayskip 10\p@ \@plus2\p@ \@minus5\p@
92 \abovedisplayshortskip \z@ \@plus3\p@
93 \belowdisplayshortskip 6\p@ \@plus3\p@ \@minus3\p@
94 (/10pt)
95 (*11pt)
96 \@setfontsize\normalsize\xipt{13.6}\%
97 \abovedisplayskip 11\p@ \@plus3\p@ \@minus6\p@
\end{verbatim}
The `\belowdisplayskip` is always equal to the `\abovedisplayskip`. The parameters of the first level list are always given by `\@listI`.

We initially choose the `\normalsize` font.

We use `\MakeRobust` instead of `\DeclareRobustCommand` above to avoid a log entry for the redefinition. But if we are running in a rollback situation (prior to 2015) we don't touch it.

This is similar to `\normalsize`.

\small
This is similar to \normalsize.

These are all much simpler than the previous macros, they just select a new
font size, but leave the parameters for displays and lists alone.
6.2 Paragraphing

These parameters control \TeX's behaviour when two lines tend to come too close together.\lineskip\normallineskip

These parameters control \TeX's behaviour when two lines tend to come too close together.\lineskip\normallineskip

\baselinestretch

This is used as a multiplier for \baselineskip. The default is to not stretch the baselines. Note that if this command doesn't resolve to “empty” any plus or minus part in the specification of \baselineskip is ignored.\renewcommand\baselinestretch{}

\parskip

\parskip gives extra vertical space between paragraphs and \parindent is the width of the paragraph indentation. The value of \parindent depends on whether we are in two-column mode.\setlength\parskip{\@plus \p@}

\parindent

\parindent gives extra vertical space between paragraphs and \parindent is the width of the paragraph indentation. The value of \parindent depends on whether we are in two-column mode.\setlength\parskip{\@plus \p@}

\smallskipamount\medskipamount\bigskipamount

The values for these three parameters are set in the L\TeX\ kernel. They should perhaps vary, according to the size option specified. But as they have always had the same value regardless of the size option we do not change them to stay compatible with both L\TeX\ 2.09 and older releases of L\TeX\ 2\epsilon.\setlength\smallskipamount{3\p@ \@plus 1\p@ \@minus 1\p@}

\medskipamount\bigskipamount
The commands \nopagebreak and \nolinebreak put in penalties to discourage these breaks at the point they are put in. They use \@lowpenalty, \@medpenalty or \@highpenalty, dependent on their argument.

These penalties are use to discourage club and widow lines. Because we use their default values we only show them here, commented out.

Discourage (but not so much) widows in front of a math display and forbid breaking directly in front of a display. Allow break after a display without a penalty. Again the default values are used, therefore we only show them here.

Allow the breaking of a page in the middle of a paragraph.

We allow the breaking of a page after a hyphenated line.

All margin dimensions are measured from a point one inch from the top and lefthand side of the page.

\headheight The \headheight is the height of the box that will contain the running head. The \headsep is the distance between the bottom of the running head and the top of the text. The \topskip is the \baselineskip for the first line on a page; \LaTeX's output routine will not work properly if it has the value 0pt, so do not do that!

(*10pt | 11pt | 12pt)
\setlength\headheight{12\p@}
\setlength\headsep {25\p@}
\setlength\headsep {.25in}
\setlength\headsep {.275in}
\setlength\topskip {10\p@}
\setlength\topskip {11\p@}
\setlength\topskip {12\p@}

\clubpenalty
\widowpenalty
\displaywidowpenalty
\predisplayskippenalty
\postdisplaypenalty
\interlinepenalty
\brokenpenalty

\setlength\headheight{12\p@}
\setlength\headsep {25\p@}
\setlength\headsep {.25in}
\setlength\headsep {.275in}
\setlength\topskip {10\p@}
\setlength\topskip {11\p@}
\setlength\topskip {12\p@}
\footnoteskip The distance from the baseline of the box which contains the running footer to the baseline of last line of text is controlled by the \footnoteskip.

\maxdepth The \TeX primitive register \maxdepth has a function that is similar to that of \topskip. The register \@maxdepth should always contain a copy of \maxdepth. This is achieved by setting it internally at \begin{document}. In both plain \TeX and \LaTeX\ 2.09 \maxdepth had a fixed value of 4pt; in native \LaTeX{} mode we let the value depend on the typesize. We set it so that \maxdepth + \topskip = \text{typsize} \times 1.5. As it happens, in these classes \topskip is equal to the typesize, therefore we set \maxdepth to half the value of \topskip.

6.3.2 The dimension of text

\textwidth When we are in compatibility mode we have to make sure that the dimensions of the printed area are not different from what the user was used to see.

\textwidth When we are not in compatibility mode we can set some of the dimensions differently, taking into account the paper size for instance.

First, we calculate the maximum \textwidth, which we will allow on the selected paper and store it in \@tempdim a. Then we store the length of a line with approximately 60–70 characters in \@tempdim b. The values given are more or less suitable when Computer Modern fonts are used.

Now we can set the \textwidth, depending on whether we will be setting one or two columns.

In two-column mode each column shouldn’t be wider than \textwidth (which could happen on A3 paper for instance).
In one-column mode the text should not be wider than the minimum of the paperwidth (minus 2 inches for the margins) and the maximum length of a line as defined by the number of characters.

Here we modify the width of the text a little to be a whole number of points.

Now that we have computed the width of the text, we have to take care of the height. The \textheight is the height of text (including footnotes and figures, excluding running head and foot).

First make sure that the compatibility mode gets the same dimensions as we had with \TEX2.09. The number of lines was calculated as the floor of the old \textheight minus \topskip, divided by \baselineskip for \normalsize. The old value of \textheight was 528pt.

Again we compute this, depending on the papersize and depending on the baselineskip that is used, in order to have a whole number of lines on the page.

We leave at least a 1 inch margin on the top and the bottom of the page.

We also have to leave room for the running headers and footers.

Then we divide the result by the current \baselineskip and store this in the count register \@tempcnta, which then contains the number of lines that fit on this page.

From this we can calculate the height of the text.
The first line on the page has a height of $\topskip$.

\topskip \addtolength\textheight{\topskip}

### 6.3.3 Margins

Most of the values of these parameters are now calculated, based on the papersize in use. In the calculations the `$\marginparsep$` needs to be taken into account so we give it its value first.

`\marginparsep` The horizontal space between the main text and marginal notes is determined by `$\marginparsep$`. `\marginparpush` The minimum vertical separation between two marginal notes is controlled by `$\marginparpush$`.

\if@twocolumn
\setlength{\marginparsep}{10\p@}
\else
\setlength{\marginparsep}{10pt}
\setlength{\marginparsep}{11pt}
\setlength{\marginparsep}{12pt}
\fi

\setlength{\marginparpush}{5\p@}
\setlength{\marginparpush}{7\p@}
\setlength{\marginparpush}{10pt}
\setlength{\marginparpush}{11pt}
\setlength{\marginparpush}{12pt}

Now we can give the values for the other margin parameters. For native \LaTeX{} 2\textbackslash e, these are calculated.

`\oddsidemargin` `\evensidemargin` `\marginparwidth` First we give the values for the compatibility mode.

\if@compatibility
\setlength{\oddsidemargin}{.5in}
\setlength{\oddsidemargin}{.25in}
\setlength{\oddsidemargin}{1.5in}
\setlength{\oddsidemargin}{1.25in}
\setlength{\oddsidemargin}{.75in}
\setlength{\oddsidemargin}{1in}
\setlength{\marginparwidth}{.75in}
\fi

\if@twoside
\setlength{\oddsidemargin}{44\p@}
\setlength{\oddsidemargin}{36\p@}
\setlength{\oddsidemargin}{21\p@}
\setlength{\oddsidemargin}{82\p@}
\setlength{\oddsidemargin}{74\p@}
\setlength{\oddsidemargin}{59\p@}
\setlength{\oddsidemargin}{107\p@}
\setlength{\oddsidemargin}{100\p@}
\setlength{\oddsidemargin}{85\p@}
\fi

Values for one-sided printing:

\else

\fi

14
When we are not in compatibility mode we can take the dimensions of the selected paper into account.

The values for \oddsidemargin and \marginparwidth will be set depending on the status of the \if@twoside.

If \@twoside is true (which is always the case for book) we make the inner margin smaller than the outer one.

With the above algorithm the \marginparwidth can come out quite large which we may not want.
Having done these calculations we make them pt values.

The \evensidemargin can now be computed from the values set above.

Setting \evensidemargin to a full point value may produce a small error. However it will lie within the error range a doublesided printer of today's technology can accurately print.

The \topmargin is the distance between the top of 'the printable area'—which is 1 inch below the top of the paper—and the top of the box which contains the running head.

It can now be computed from the values set above.

By changing the factor in the next line the complete page can be shifted vertically.

6.3.4 Footnotes

\footnotesep is the height of the strut placed at the beginning of every footnote. It equals the height of a normal \footnotesize strut in this class, thus no extra space occurs between footnotes.

\footins \skip\footins is the space between the last line of the main text and the top of the first footnote.
6.3.5 Float placement parameters

All float parameters are given default values in the \LaTeX\ 2\epsilon kernel. For this reason parameters that are not counters need to be set with \texttt{\renewcommand}.

**Limits for the placement of floating objects**

\texttt{\c@topnumber} The \textit{topnumber} counter holds the maximum number of floats that can appear on the top of a text page.

\texttt{\setcounter{topnumber}{2}}

\texttt{\topfraction} This indicates the maximum part of a text page that can be occupied by floats at the top.

\texttt{\renewcommand{\topfraction}{.7}}

\texttt{\c@bottomnumber} The \textit{bottomnumber} counter holds the maximum number of floats that can appear on the bottom of a text page.

\texttt{\setcounter{bottomnumber}{1}}

\texttt{\bottomfraction} This indicates the maximum part of a text page that can be occupied by floats at the bottom.

\texttt{\renewcommand{\bottomfraction}{.3}}

\texttt{\c@totalnumber} This indicates the maximum number of floats that can appear on any text page.

\texttt{\setcounter{totalnumber}{3}}

\texttt{\textfraction} This indicates the minimum part of a text page that has to be occupied by text.

\texttt{\renewcommand{\textfraction}{.2}}

\texttt{\floatpagefraction} This indicates the minimum part of a page that has to be occupied by floating objects before a ‘float page’ is produced.

\texttt{\renewcommand{\floatpagefraction}{.5}}

\texttt{\c@dbltopnumber} The \textit{dbltopnumber} counter holds the maximum number of two-column floats that can appear on the top of a two-column text page.

\texttt{\setcounter{dbltopnumber}{2}}

\texttt{\dbltopfraction} This indicates the maximum part of a two-column text page that can be occupied by two-column floats at the top.

\texttt{\renewcommand{\dbltopfraction}{.7}}

\texttt{\dblfloatpagefraction} This indicates the minimum part of a page that has to be occupied by two-column wide floating objects before a ‘float page’ is produced.

\texttt{\renewcommand{\dblfloatpagefraction}{.5}}

(//article | report | book)
**Floats on a text page**

\texttt{\floatsep}  When a floating object is placed on a page with text, these parameters control the separation between the float and the other objects on the page. These parameters are used for both one-column mode and single-column floats in two-column mode.

\texttt{\textfloatsep}  is the space between adjacent floats that are moved to the top or bottom of the text page.

\texttt{\intextsep}  is the space between the main text and floats at the top or bottom of the page.

\texttt{\intextsep}  is the space between in-text floats and the text.

\begin{verbatim}
\setlength{\floatsep}{12\p@ \@plus 2\p@ \@minus 2\p@}
\setlength{\textfloatsep}{20\p@ \@plus 2\p@ \@minus 4\p@}
\setlength{\intextsep}{12\p@ \@plus 2\p@ \@minus 2\p@}
\end{verbatim}

\texttt{\dblfloatsep}  When floating objects that span the whole \texttt{\textwidth} are placed on a text page when we are in two-column mode the separation between the float and the text is controlled by \texttt{\dblfloatsep} and \texttt{\dbltextfloatsep}.

\texttt{\dblfloatsep}  is the space between adjacent floats that are moved to the top or bottom of the page.

\texttt{\dbltextfloatsep}  is the space between the main text and floats at the top or bottom of the page.

\begin{verbatim}
\setlength{\dblfloatsep}{12\p@ \@plus 2\p@ \@minus 2\p@}
\setlength{\dbltextfloatsep}{20\p@ \@plus 2\p@ \@minus 4\p@}
\end{verbatim}

**Floats on their own page or column**

\texttt{\@fptop}  When floating objects are placed on separate pages the layout of such pages is controlled by these parameters. At the top of the page \texttt{\@fptop} amount of stretchable whitespace is inserted, at the bottom of the page we get an \texttt{\@fpbot} amount of stretchable whitespace. Between adjacent floats the \texttt{\@fpsep} is inserted.

\begin{verbatim}
\setlength{\@fptop}{12\p@ \@plus 2\p@ \@minus 4\p@}
\setlength{\@fpsep}{20\p@ \@plus 2\p@ \@minus 4\p@}
\setlength{\@fpbot}{14\p@ \@plus 4\p@ \@minus 4\p@}
\end{verbatim}
These parameters are used for the placement of floating objects in one-column mode, or in single-column floats in two-column mode.

Note that at least one of the two parameters \@fptop and \@fpbot should contain a plus ...fil to allow filling the remaining empty space.

\setlength\@fptop{0\p@ \@plus 1fil}
\setlength\@fpsep{8\p@ \@plus 2fil}
\setlength\@fpbot{0\p@ \@plus 1fil}
(/10pt)

\setlength\@dblfptop{0\p@ \@plus 1fil}
\setlength\@dblfpsep{8\p@ \@plus 2fil}
\setlength\@dblfpbot{0\p@ \@plus 1fil}
(/10pt)

\setlength\@fptop{0\p@ \@plus 1fil}
\setlength\@fpsep{8\p@ \@plus 2fil}
\setlength\@fpbot{0\p@ \@plus 1fil}
(/11pt)

\setlength\@dblfptop{0\p@ \@plus 1fil}
\setlength\@dblfpsep{10\p@ \@plus 2fil}
\setlength\@dblfpbot{0\p@ \@plus 1fil}
(/12pt)

\@evenhead \@oddhead \@evenfoot \@oddfoot

Double-column floats in two-column mode are handled with similar parameters.

\setlength\@dblfptop{0\p@ \@plus 1fil}
\setlength\@dblfpsep{8\p@ \@plus 2fil}
\setlength\@dblfpbot{0\p@ \@plus 1fil}
(/10pt)

\setlength\@dblfptop{0\p@ \@plus 1fil}
\setlength\@dblfpsep{8\p@ \@plus 2fil}
\setlength\@dblfpbot{0\p@ \@plus 1fil}
(/11pt)

\setlength\@dblfptop{0\p@ \@plus 1fil}
\setlength\@dblfpsep{10\p@ \@plus 2fil}
\setlength\@dblfpbot{0\p@ \@plus 1fil}
(/12pt)

6.4 Page Styles

The page style foo is defined by defining the command \ps@foo. This command should make only local definitions. There should be no stray spaces in the definition, since they could lead to mysterious extra spaces in the output (well, that’s something that should be always avoided).

\@evenhead The \ps@... command defines the macros \@oddhead, \@oddfoot, \@evenhead, \@oddhead and \@evenfoot to define the running heads and feet—e.g., \@oddhead is the \@evenfoot macro to produce the contents of the heading box for odd-numbered pages. It is \@oddfoot called inside an \hbox of width \textwidth.
6.4.1 Marking conventions

To make headings determined by the sectioning commands, the page style defines
the commands \chaptermark, \sectionmark, ..., where \chaptermark\{
\langle TEXT \rangle\} is called by \chapter to set a mark, and so on.

The \...mark commands and the \...head macros are defined with the help
of the following macros. (All the \...mark commands should be initialized to
no-ops.)

\LaTeX{} extends \TeX{}’s \mark facility by producing two kinds of marks, a ‘left’
and a ‘right’ mark, using the following commands:

\markboth{\langle LEFT \rangle}{\langle RIGHT \rangle}: Adds both marks.
\markright{\langle RIGHT \rangle}: Adds a ‘right’ mark.
\leftmark: Used in the \@oddhead, \@oddfoot, \@evenhead or \@evenfoot
macros, it gets the current ‘left’ mark. \leftmark works like \TeX{}’s \botmark
command.
\rightmark: Used in the \@oddhead, \@oddfoot, \@evenhead or \@evenfoot
macros, it gets the current ‘right’ mark. \rightmark works like \TeX{}’s
\firstmark command.

The marking commands work reasonably well for right marks ‘numbered
within’ left marks—e.g., the left mark is changed by a \chapter command and
the right mark is changed by a \section command. However, it does produce
somewhat anomalous results if two \markboth’s occur on the same page.

Commands like \tableofcontents that should set the marks in some page
styles use a \@mkboth command, which is \let by the pagestyle command
(\ps@...) to \markboth for setting the heading or to \@gobbletwo to do nothing.

6.4.2 Defining the page styles

The pagestyles empty and plain are defined in the \LaTeX{} format.

\ps@headings The definition of the page style headings has to be different for two sided printing
than it is for one sided printing.

\let\@oddfoot\@empty\let\@evenfoot\@empty
\def\@evenhead{\thepage\hfil\slshape\leftmark}\
\def\@oddhead{{\slshape\rightmark}\hfil\thepage}\

When using this page style, the contents of the running head is determined by
the chapter and section titles. So we \let \@mkboth to \markboth.
\let\@mkboth\markboth

For the article document class we define \sectionmark to clear the right mark
and put the number of the section (when it is numbered) and its title in the left
mark. The rightmark is set by \subsectionmark to contain the subsection titles.

Note the use of ##1 for the parameter of the \sectionmark command, which
will be defined when \ps@headings is executed.
In the report and book document classes we use the \chaptermark and \sectionmark macros to fill the running heads. 

Note the use of ##1 for the parameter of the \chaptermark command, which will be defined when \ps@headings is executed.

The definition of \ps@headings for one sided printing can be much simpler, because we treat even and odd pages the same. Therefore we don’t need to define \@even...

We use \markright now instead of \markboth as we did for two sided printing.
The definition of the page style *myheadings* is fairly simple because the user determines the contents of the running head himself by using the \markboth and \markright commands.

\ps@myheadings

We have to make sure that the marking commands that are used by the chapter and section headings are disabled. We do this by setting them to a macro that gobbles its argument(s).

\let\@mkboth\@gobbletwo
\let\chaptermark\@gobble
\let\sectionmark\@gobble
\let\subsectionmark\@gobble

---

### 7 Document Markup

#### 7.1 The title

The definition of \maketitle depends on whether a separate title page is made. This is the default for the report and book document classes, but for the article class it is optional.

When we are making a title page, we locally redefine \footnotesize and \footnoterule to change the appearance of the footnotes that are produced by the \thanks command; these changes affect all footnotes.
We center the entire title vertically; the centering is set off a little by adding a \vskip. (In compatibility mode the page number is set to 0 by the titlepage environment to keep the behaviour of \LaTeX{} 2.09 style files.)

Then we set the title, in a \LARGE font; leave a little space and set the author(s) in a \large font. We do this inside a tabular environment to get them in a single column. Before the date we leave a little whitespace again.

Then we call \@thanks to print the information that goes into the footnote and finish the page.

We reset the footnote counter, disable \thanks and \maketitle and save some storage space by emptying the internal information macros.

After the title is set the declaration commands \title, etc. can vanish. The definition of \and makes only sense within the argument of \author so this can go as well.

When the title is not on a page of its own, the layout of the title is a little different. We use symbols to mark the footnotes and we have to deal with two-column documents.

Therefore we first start a new group to keep changes local. Then we redefine thefootnote to use \fnsymbol: and change \@makefnmark so that footnotemarks have zero width (to make the centering of the author names look better).
\newcommand{\maketitle}{\par
\begin{group}
\renewcommand{\thefootnote}{\@fnsymbol{\c@footnote}}%
\def{\makefnmark}{\rlap{\@textsuperscript{\normalfont\@thefnmark}}}%
\long\def{\makefntext##1}{\parindent 1em
\noindent
\hb@xt@1.8em{\hss\@textsuperscript{\normalfont\@thefnmark}}##1}%
\if@twocolumn
\ifnum{\col@number=\@ne}
\maketitle
\else
\twocolumn[\maketitle]%
\fi
\else
\twocolumn[\maketitle]%
\fi
\fi
This macro takes care of formatting the title information when we have no separate title page.

We always start a new page, leave some white space and center the information.
The title is set in a \textbf{\LARGE} font, the author names and the date in a \textbf{\large} font.
\def{\maketitle}{%\null\newpage
\global{\topnum=0} % Prevents figures from going at top of page.
\maketitle
\fi
This page gets a plain layout. We call \@thanks to produce the footnotes.
\thispagestyle{plain}\@thanks
Now we can close the group, reset the footnote counter, disable \thanks, \maketitle and \@maketitle and save some storage space by emptying the internal information macros.
\endgroup
\setcounter{footnote}{0}%
\global{\let{\thanks}=\relax}
\global{\let{\maketitle}=\relax}
\global{\let{@maketitle}=\relax}
\global{\let{\@author}=\@empty}
\global{\let{\@date}=\@empty}
\global{\let{\@title}=\@empty}
\global{\let{\title}=\relax}
\global{\let{\author}=\relax}
\global{\let{\date}=\relax}
\global{\let{\and}=\relax}
}
7.2 Chapters and Sections

7.2.1 Building blocks

The definitions in this part of the class file make use of two internal macros, \@startsection and \secdef. To understand what is going on here, we describe
their syntax.

The macro \@startsection has 6 required arguments, optionally followed by
a *, an optional argument and a required argument:

\@startsection{⟨name⟩}{⟨level⟩}{⟨indent⟩}{⟨beforeskip⟩}{⟨afterskip⟩}{⟨style⟩} optional *

[⟨altheading⟩] ⟨heading⟩

It is a generic command to start a section, the arguments have the following
meaning:

⟨name⟩ The name of the user level command, e.g., ‘section’.

⟨level⟩ A number, denoting the depth of the section – e.g., chapter=1, section = 2, etc. A section number will be printed if and only if ⟨level⟩ ≤ the value of the secnumdepth counter.

⟨indent⟩ The indentation of the heading from the left margin

⟨beforeskip⟩ The absolute value of this argument gives the skip to leave above the heading. If it is negative, then the paragraph indent of the text following the heading is suppressed.

⟨afterskip⟩ If positive, this gives the skip to leave below the heading, else it gives the skip to leave to the right of a run-in heading.

⟨style⟩ Commands to set the style of the heading.

* When this is missing the heading is numbered and the corresponding counter is incremented.

⟨altheading⟩ Gives an alternative heading to use in the table of contents and in the running heads. This should not be present when the * form is used.

⟨heading⟩ The heading of the new section.
A sectioning command is normally defined to \@startsection and its first six arguments.

The macro \secdef can be used when a sectioning command is defined without using \@startsection. It has two arguments:
\secdef⟨ unstarcmds ⟩ ⟨ startcmds ⟩

⟨ unstarcmds ⟩ Used for the normal form of the sectioning command.
⟨ startcmds ⟩ Used for the *-form of the sectioning command.

You can use \secdef as follows:
\def\chapter { ... \secdef \CMDA \CMDB }
\def\CMDA [#1]#2{ ... } % Command to define \chapter{...}
\def\CMDB #1{ ... } % Command to define \chapter*{...}

7.2.2 Mark commands
\chaptermark \sectionmark \subsectionmark \subsubsectionmark \paragraphmark \subparagraphmark

Default initializations of \ldots mark commands. These commands are used in the definition of the page styles (see section 6.4.2) Most of them are already defined by the \LaTeX format, so they are only shown here.
633 ⟨ article ⟩ \newcommand*\chaptermark{1}{}
634 % \newcommand*\sectionmark{1}{}
635 % \newcommand*\subsectionmark{1}{}
636 % \newcommand*\subsubsectionmark{1}{}
637 % \newcommand*\paragraphmark{1}{}
638 % \newcommand*\subparagraphmark{1}{}

7.2.3 Define Counters
\c@secnumdepth

The value of the counter secnumdepth gives the depth of the highest-level sectioning command that is to produce section numbers.
639 ⟨ article ⟩ \setcounter{secnumdepth}{3}
640 ⟨ article ⟩ \setcounter{secnumdepth}{2}

\c@part
\c@section
\c@subsection
\c@paragraph
\c@subparagraph

These counters are used for the section numbers. The macro \newcounter{newctr}[oldctr] defines\newctr to be a counter, which is reset to zero when counter \oldctr is stepped. Counter \oldctr must already be defined.
641 \newcounter {part}
642 ⟨ article ⟩ \newcounter {section}
643 ⟨ report | book ⟩ \newcounter {chapter}
644 \newcounter {subsection}
645 \newcounter {subsubsection}
646 ⟨ report | book ⟩ \newcounter {paragraph}
647 \newcounter {subparagraph}
648 \newcounter {paragraph}
649 \newcounter {subparagraph}
650 \newcounter {paragraph}
For any counter $CTR$, $\texttt{thecounter CTR}$ is a macro that defines the printed version of counter $CTR$. It is defined in terms of the following macros:

- $\texttt{arabic\{COUNTER\}}$ prints the value of $COUNTER$ as an arabic numeral.
- $\texttt{roman\{COUNTER\}}$ prints the value of $COUNTER$ as a lowercase roman numeral.
- $\texttt{Roman\{COUNTER\}}$ prints the value of $COUNTER$ as an uppercase roman numeral.
- $\texttt{alph\{COUNTER\}}$ prints the value of $COUNTER$ as a lowercase letter: $1 = a$, $2 = b$, etc.
- $\texttt{Alph\{COUNTER\}}$ prints the value of $COUNTER$ as an uppercase letter: $1 = A$, $2 = B$, etc.

Actually to save space the internal counter representations and the commands operating on those are used.

$\texttt{\renewcommand \thepart \{\@Roman\c@part\}}$

$\langle \texttt{article} \rangle \texttt{\renewcommand \thesection \{\@arabic\c@section\}}$

$\langle * \texttt{report} | \texttt{book} \rangle$

$\texttt{\renewcommand \thechapter \{\@arabic\c@chapter\}}$

$\texttt{\renewcommand \thesection \{\thechapter.\@arabic\c@section\}}$

$\langle / \texttt{report} | \texttt{book} \rangle$

$\texttt{\renewcommand \thesubsection \{\thesection.\@arabic\c@subsection\}}$

$\texttt{\renewcommand \thesubsubsection \{\thesubsection.\@arabic\c@subsubsection\}}$

$\texttt{\renewcommand \theparagraph \{\thesubsubsection.\@arabic\c@paragraph\}}$

$\texttt{\renewcommand \thesubparagraph \{\theparagraph.\@arabic\c@subparagraph\}}$

$\texttt{\@chapapp}$ $\@chapapp$ is initially defined to be $\texttt{\chaptername}$. The $\texttt{\appendix}$ command redefines it to be $\texttt{\appendixname}$.

$\langle \texttt{report} | \texttt{book} \rangle \texttt{\newcommand \@chapapp \{\chaptername\}}$

### 7.2.4 Front Matter, Main Matter, and Back Matter

A book contains these three (logical) sections. The switch $\@mainmatter$ is true iff we are processing Main Matter. When this switch is false, the $\texttt{\chapter}$ command does not print chapter numbers.

Here we define the commands that start these sections.

$\texttt{\frontmatter}$ This command starts Roman page numbering and turns off chapter numbering. Since this restarts the page numbering from 1, it should also ensure that a recto page is used.

$\langle * \texttt{book} \rangle$

$\texttt{\newcommand \frontmatter \{\%}$

$\texttt{\if@openright \texttt{\cleardoublepage} \%}$

$\texttt{\else \texttt{\clearpage} \%}$

$\texttt{\fi \%}$

$\texttt{\@mainmatterfalse \%}$

$\texttt{\pagenumbering \{roman\}}$

$\texttt{\%}$

$\texttt{\\}}$

$\texttt{\mainmatter}$ This command clears the page, starts arabic page numbering and turns on chapter numbering. Since this restarts the page numbering from 1, it should also ensure that a recto page is used.

$\texttt{\newcommand \mainmatter \{\%}$

$\texttt{\}}$

$\texttt{\%}$

$\texttt{\}}$
This clears the page, turns off chapter numbering and leaves page numbering unchanged.

\backmatter This clears the page, turns off chapter numbering and leaves page numbering unchanged.
\newcommand{\backmatter}{% 
  \if@openright 
  \cleardoublepage 
  \else 
  \clearpage 
  \fi 
  \@mainmatterfalse}\
\part
The command to start a new part of our document.

In the article class the definition of \part is rather simple; we start a new paragraph, add a little white space, suppress the indentation of the first paragraph and make use of \secdef. As in other sectioning commands (cf. \@startsection in the \LaTeX\ 2\epsilon\ kernel), we need to check the @noskipsec switch and force horizontal mode if it is set.

\newcommand{\part}{% 
  \if@noskipsec \leavevmode \fi 
  \par 
  \addvspace{4ex} 
  \@afterindentfalse 
  \secdef{\@part}{@spart} 
}\
\backmatter
\part
The command to start a new part of our document.

7.2.5 Parts

\part
The command to start a new part of our document.

\newcommand{\part}{% 
  \if@openright 
  \cleardoublepage 
  \else 
  \clearpage 
  \fi 
  \thispagestyle{plain} 
}\
\backmatter
\part
The command to start a new part of our document.

\newcommand{\part}{% 
  \if@openright 
  \cleardoublepage 
  \else 
  \clearpage 
  \fi 
  \@tempswa 
  \\if@twocolumn 
  \onecolumn 
  \@tempswatrue 
  \else 
  \@tempswafalse 
  \fi 
}\
The command to start a new part of our document.

\newcommand{\part}{% 
  \if@openright 
  \cleardoublepage 
  \else 
  \clearpage 
  \fi 
  \@tempswap 
  \if@twocolumn 
  \onecolumn 
  \@tempswaptrue 
  \else 
  \@tempswafalse 
  \fi 
}\
\backmatter
\part
The command to start a new part of our document.

\newcommand{\part}{% 
  \if@openright 
  \cleardoublepage 
  \else 
  \clearpage 
  \fi 
  \@tempswap 
  \if@twocolumn 
  \onecolumn 
  \@tempswaptrue 
  \else 
  \@tempswafalse 
  \fi 
}\
\backmatter
\part
The command to start a new part of our document.

\newcommand{\part}{% 
  \if@openright 
  \cleardoublepage 
  \else 
  \clearpage 
  \fi 
  \@tempswap 
  \if@twocolumn 
  \onecolumn 
  \@tempswaptrue 
  \else 
  \@tempswafalse 
  \fi 
}\
\backmatter
\part
The command to start a new part of our document.
We need an empty box to prevent the fill glue from disappearing.

Here we use \seccdef to indicate which commands to use to make the actual heading.

\seccdef\@part\@spart

\@part This macro does the actual formatting of the title of the part. Again the macro is differently defined for the article document class than for the document classes report and book.

When secnumdepth is larger than $-1$ for the document class article, we have a numbered part, otherwise it is unnumbered.

\def\@part[#1]#2{\ifnum\c@secnumdepth >\m@ne\refstepcounter{part}\addcontentsline{toc}{part}{\thepart\hspace{1em}#1}\else\addcontentsline{toc}{part}{#1}\fi\parindent\z@\raggedright\interlinepenalty\@M\normalfont

When this is a numbered part we have to print the number and the title. The \nobreak should prevent a page break here.

\ifnum\c@secnumdepth >\m@ne\Large\bfseries \partname\nobreakspace\thepart\par
\fi

Now we empty the mark registers, leave some white space and let \@afterheading take care of suppressing the indentation.

\markboth{}{}\par

When secnumdepth is larger than $-2$ for the document class report and book, we have a numbered part, otherwise it is unnumbered.

\def\@part[#1]#2{\ifnum\c@secnumdepth >-2\relax\refstepcounter{part}\addcontentsline{toc}{part}{\thepart\hspace{1em}#1}\else\addcontentsline{toc}{part}{#1}\fi\parindent\z@\skip3em\@afterheading}
We empty the mark registers and center the title on the page in the report and book document classes. Also we prevent breaking between lines and reset the font.

When this is a numbered part we have to print the number.

We leave some space before we print the title and leave the finishing up to `\@endpart`.

This macro does the actual formatting of the title of the part when the star form of the user command was used. In this case we never print a number. Otherwise the formatting is the same.

The differences between the definition of this macro in the article document class and in the report and book document classes are similar as they were for `\@part`.

This macro finishes the part page, for both `\@part` and `\@spart`.

First we fill the current page.

Then, when we are in twosided mode and chapters are supposed to be on right hand sides, we produce a completely blank page.
When this was a two-column document we have to switch back to two-column mode.

\if@tempswa
\twocolumn
\fi}

\newcommand\chapter{
\if@openright\cleardoublepage\else\clearpage\fi
\thispagestyle{plain}\

Then we prevent floats from appearing at the top of this page because it looks weird to see a floating object above a chapter title.

\global\@topnum\z@)

Then we suppress the indentation of the first paragraph by setting the switch \@afterindent to false. We use \secdef to specify the macros to use for actually setting the chapter title.

\@afterindentfalse
\secdef\@chapter\@schapter}
\@chapter

This macro is called when we have a numbered chapter. When secnumdepth is larger than \-1 and, in the book class, \@mainmatter is true, we display the chapter number. We also inform the user that a new chapter is about to be typeset by writing a message to the terminal.

\def\@chapter[#1]#2{\ifnum \c@secnumdepth >\m@ne
\if@mainmatter
\refstepcounter{chapter}\
\typeout{\@chapapp\space\thechapter.}\%
\addcontentsline{toc}{chapter}{\protect\numberline{\thechapter}#1}\%
\else
\addcontentsline{toc}{chapter}{#1}\%
\fi
\else
\addcontentsline{toc}{chapter}{#1}\%
\fi
}
\chapter

After having written an entry to the table of contents we store the (alternative) title of this chapter with \chaptermark and add some white space to the lists of figures and tables.

\chaptermark{#1}\

31
Then we call upon \@makechapterhead to format the actual chapter title. We have to do this in a special way when we are in two-column mode in order to have the chapter title use the entire \textwidth. In one-column mode we call \@afterheading which takes care of suppressing the indentation.

\begin{macrocode}
def \@makechapterhead#1{% 
   \vspace*{50\p@}% 
   \parindent \z@ \raggedright \normalfont
   \ifnum \c@secnumdepth >\m@ne
      ⟨book⟩\if@mainmatter
         \huge \bfseries \@chapapp \thechapter
         \par \nobreak
         \vskip 20\p@
      ⟨book⟩\fi
   \fi
   \Huge \bfseries #1\par \nobreak
   \vskip 40\p@
}\end{macrocode}

\@makechapterhead The macro above uses \@makechapterhead\textup{⟨text⟩} to format the heading of the chapter.

We begin by leaving some white space. Then we open a group in which we have a paragraph indent of 0pt, and in which we have the text set ragged right. We also reset the font.

\begin{macrocode}
def \@makechapterhead#1{% 
   \vspace*{50\p@}% 
   \parindent \z@ \raggedright \normalfont
   \ifnum \c@secnumdepth >\m@ne
      ⟨book⟩\if@mainmatter
         \huge \bfseries \@chapapp \thechapter
         \par \nobreak
         \vskip 20\p@
      ⟨book⟩\fi
   \fi
   \Huge \bfseries #1\par \nobreak
   \vskip 40\p@
}\end{macrocode}

This macro is called when we have an unnumbered chapter. It is much simpler than \@chapter because it only needs to typeset the chapter title.

\begin{macrocode}
def \@schapter#1{% 
   \ifnum \c@secnumdepth >\m@ne
      ⟨book⟩\if@mainmatter
         \huge \bfseries \@chapapp \space \thechapter
         \par \nobreak
         \vskip 20\p@
      ⟨book⟩\fi
   \fi
}\end{macrocode}

\@schapter This macro is called when we have an unnumbered chapter. It is much simpler than \@chapter because it only needs to typeset the chapter title.

\begin{macrocode}
def \@schapter#1{% 
   \ifnum \c@secnumdepth >\m@ne
      ⟨book⟩\if@mainmatter
         \huge \bfseries \@chapapp \space \thechapter
         \par \nobreak
         \vskip 20\p@
      ⟨book⟩\fi
   \fi
}\end{macrocode}

\@makeschapterhead The macro above uses \@makeschapterhead\textup{⟨text⟩} to format the heading of the chapter. It is similar to \@makechapterhead except that it never has to print a chapter number.
7.2.7 Lower level headings

These commands all make use of \@startsection.

\section This gives a normal heading with white space above and below the heading, the title set in \Large\bfseries, and no indentation on the first paragraph.
\subsection This gives a normal heading with white space above and below the heading, the title set in \large\bfseries, and no indentation on the first paragraph.
\subsubsection This gives a normal heading with white space above and below the heading, the title set in \normalsize\bfseries, and no indentation on the first paragraph.
\paragraph This gives a run-in heading with white space above and to the right of the heading, the title set in \normalsize\bfseries.
\subparagraph This gives an indented run-in heading with white space above and to the right of the heading, the title set in \normalsize\bfseries.
7.3 Lists

7.3.1 General List Parameters

The following commands are used to set the default values for the list environment’s parameters. See the \LaTeX{} manual for an explanation of the meanings of the parameters. Defaults for the list environment are set as follows. First, \texttt{\rightmargin}, \texttt{\listparindent} and \texttt{\itemindent} are set to 0pt. Then, for a \textit{Kth} level list, the command \texttt{\@listK} is called, where ‘K’ denotes ‘i’, ‘ii’, ..., ‘vi’. (i.e., \texttt{\@listiii} is called for a third-level list.) By convention, \texttt{\@listK} should set \texttt{\leftmargin} to \texttt{\leftmarginK}.

\begin{verbatim}
\leftmargin \leftmargini
\leftmarginii \leftmarginiii
\leftmarginiv \leftmarginv
\leftmarginvi
\rightmargin \listparindent \itemindent
\if@twocolumn
\setlength\leftmargini \setlength\leftmarginii \setlength\leftmarginiii
\setlength\leftmarginiv \setlength\leftmarginv \setlength\leftmarginvi
\else
\fi
\end{verbatim}

Until the whole of the parameter setting in these files is rationalised, we need to set the value of \texttt{\leftmargin} at this outer level.

\begin{verbatim}
\leftmargin \leftmargini
\end{verbatim}

The following three are calculated so that they are larger than the sum of \texttt{\labelsep} and the width of the default labels (which are ‘(m)’, ‘vii.’ and ‘M.’).

\begin{verbatim}
\setlength\leftmarginii \setlength\leftmarginiii \setlength\leftmarginiv
\if@twocolumn
\setlength\leftmarginv \setlength\leftmarginvi
\else
\fi
\end{verbatim}

\texttt{\labelsep} is the distance between the label and the text of an item; \texttt{\labelwidth} is the width of the label.

\begin{verbatim}
\setlength \labelsep \setlength \labelwidth
\addtolength \labelwidth \labelsep
\end{verbatim}

\texttt{\partopsep} When the user leaves a blank line before the environment an extra vertical space of \texttt{\partopsep} is inserted, in addition to \texttt{\parskip} and \texttt{\topsep}.

\begin{verbatim}
\setlength \partopsep \setlength \partopsep[2]\p@ \@plus \p@ \@minus \p@ \setlength \partopsep[3]\p@ \@plus \p@ \@minus \p@ \setlength \partopsep[3]\p@ \@plus \p@ \@minus \p@ \setlength \partopsep[3]\p@ \@plus \p@ \@minus \p@
\end{verbatim}

\texttt{\@beginparpenalty} These penalties are inserted before and after a list or paragraph environment.

\texttt{\@endparpenalty} They are set to a bonus value to encourage page breaking at these points.

\texttt{\@itempenalty} This penalty is inserted between list items.

\texttt{\@article | report | book}

\texttt{\@article | report | book}

34
\@listi \@listi defines the values of \leftmargin, \parsep, \topsep, \itemsep, etc. for the lists that appear on top-level. Its definition is modified by the font-size commands (eg within \small the list parameters get “smaller” values).

For this reason listI is defined to hold a saved copy of list so that \normalsize can switch all parameters back.

\let\@listI\@listi

We initialise the parameters although strictly speaking that is not necessary.

\listii Here are the same macros for the higher level lists. Note that they don’t have saved versions and are not modified by the font size commands. In other words this class assumes that nested lists only appear in \normalsize, i.e. the main document size.

\listiii \listiv \listv \listvi
7.3.2 Enumerate

The enumerate environment uses four counters: \textit{enumi}, \textit{enumii}, \textit{enumiii} and \textit{enumiv}, where \textit{enumN} controls the numbering of the Nth level enumeration.

The counters are already defined in the \LaTeX format, but their representation is changed here.

\begin{verbatim}
\renewcommand\theenumi{\@arabic\c@enumi}
\renewcommand\theenumii{\@alph\c@enumii}
\renewcommand\theenumiii{\@roman\c@enumiii}
\renewcommand\theenumiv{\@Alph\c@enumiv}
\end{verbatim}

The label for each item is generated by the commands \texttt{\labelenumi} ... \texttt{\labelenumiv}.

\begin{verbatim}
\newcommand\labelenumi{\theenumi.}
\newcommand\labelenumii{\textbullet}
\newcommand\labelenumiii{\textbullet}
\newcommand\labelenumiv{\textbullet}
\end{verbatim}

The expansion of \texttt{\p@enumN\theenumN} defines the output of a \texttt{\ref} command when referencing an item of the Nth level of an enumerated list.

\begin{verbatim}
\newcommand\p@enumi{\theenumi}
\newcommand\p@enumii{\theenumii}
\newcommand\p@enumiii{\theenumiii}
\newcommand\p@enumiv{\theenumiv}
\end{verbatim}

7.3.3 Itemize

Itemization is controlled by four commands: \texttt{\labelitemi}, \texttt{\labelitemii}, \texttt{\labelitemiii}, and \texttt{\labelitemiv}, which define the labels of the various itemization levels: the symbols used are bullet, bold en-dash, centered asterisk and centred dot.

\begin{verbatim}
\newcommand\labelitemi{\textbullet}
\newcommand\labelitemii{\textbullet}
\newcommand\labelitemiii{\textbullet}
\newcommand\labelitemiv{\textbullet}
\end{verbatim}
\labelitemfont The default definition for \labelitemfont is to reset the font to \normalfont so that always the same symbol is produced regardless of surrounding conditions.

Possible alternatives would be, for example,

\renewcommand\labelitemfont {\normalsize \fontfamily{lmss}\selectfont}
\renewcommand\labelitemfont {\rmfamily\normalsize}

the first would use symbols from Latin Modern Sans, the second would only allow changes in the font series so that an itemize in a bold context would produce bolder symbols.

\newcommand\labelitemfont{\normalfont}

7.3.4 Description

description (env.) The description environment is defined here – while the itemize and enumerate environments are defined in the \LaTeX{} format.

\newenvironment{description}{\list{}{\labelwidth\z@ \itemindent\leftmargin
\let\makelabel\descriptionlabel}}{\endlist}
\descriptionlabel
To change the formatting of the label, you must redefine \descriptionlabel.

\newcommand*\descriptionlabel[1]{\hspace\labelsep \normalfont\bfseries #1}

7.4 Defining new environments

7.4.1 Abstract

abstract (env.) When we are producing a separate titlepage we also put the abstract on a page of its own. It will be centred vertically on the page.

Note that this environment is not defined for books.

\newenvironment{abstract}{%\egin{center}\fseries \abstractname
\begin{center}%
\end{abstract}%
\end{center}%
When we are not making a separate titlepage—the default for the article document class—we have to check if we are in two-column mode. In that case the abstract is as a \section*, otherwise the quotation environment is used to typeset the abstract.

\begin{verbatim}
\else
\newenvironment{abstract}{%
  \if@twocolumn
   \section*{\abstractname}%
  \else
   \small
   \begin{center}
   {\bfseries \abstractname\vspace{-.5em}\vspace{\z@}}
   \end{center}
   \quotation
  \fi}
  {\if@twocolumn\else\endquotation\fi}
\fi
\end{verbatim}

7.4.2 Verse

\texttt{verse (env.)} The verse environment is defined by making clever use of the list environment’s parameters. The user types \\
\texttt{to end a line. This is implemented by }\texttt{let'ing }\\\texttt{equal }\texttt{centercr.}

\begin{verbatim}
\newenvironment{verse}{\let\\@centercr
\list{}{\itemsep \z@ 
\itemindent -1.5em%
\listparindent\itemindent 
\rightmargin \leftmargin 
\parsep \z@ \@plus@p@
}\item\relax}
{\endlist}
\end{verbatim}

7.4.3 Quotation

\texttt{quotation (env.)} The quotation environment is also defined by making clever use of the list environment’s parameters. The lines in the environment are set smaller than \textwidth. The first line of a paragraph inside this environment is indented.

\begin{verbatim}
\newenvironment{quotation}{\list{}{\listparindent 1.5em%
\itemindent \listparindent 
\rightmargin \leftmargin 
\parsep \z@ \@plus@p@
}\item\relax}
{\endlist}
\end{verbatim}

7.4.4 Quote

\texttt{quote (env.)} The quote environment is like the quotation environment except that paragraphs are not indented.

\begin{verbatim}
\newenvironment{quote}
{\list{}{\itemindent \listparindent 
\rightmargin \leftmargin 
\parsep \z@ \@plus@p@
}\item\relax}
{\endlist}
\end{verbatim}

38
7.4.5 Theorem

This document class does not define its own theorem environments, the defaults, supplied by the LaTeX format are available.

7.4.6 Titlepage

titlepage env. In the normal environments, the titlepage environment does nothing but start and end a page, and inhibit page numbers. When \LaTeX is in two-column mode, the environment temporarily switches to one-column mode. In the report class, it also resets the page number to one, and then, in two-column mode, sets it back to one at the end. For the book class the environment makes sure that the title page is on a recto page by issuing a \cleardoublepage command. In compatibility mode, it sets the page number to zero. This is incorrect since it results in using the page parameters for a right-hand page but it is the way it was.

First we do give the definition for compatibility mode.

And here is the one for native \LaTeX e.

If we are not in two-side mode the first page after the title page should also get page number 1.
7.4.7 Appendix

The \appendix command is not really an environment, it is a macro that makes
some changes in the way things are done.

In the article document class the \appendix command must do the following:

• reset the section and subsection counters to zero,
• redefine \thesection to produce alphabetic appendix numbers. This redef-
  definition is done globally to ensure that it survives even if \appendix is issued
  within an environment such as multicols.

\newcommand\appendix{\par
\setcounter{section}{0}\
\setcounter{subsection}{0}\
\gdef\thesection{@Alph\c@section}}

In the report and book document classes the \appendix command must do
the following:

• reset the chapter and section counters to zero,
• set \@chapapp to \appendixname (for messages),
• redefine the chapter counter to produce appendix numbers,
• possibly redefine the \chapter command if appendix titles and headings
  are to look different from chapter titles and headings. This redefinition is
  done globally to ensure that it survives even if \appendix is issued within
  an environment such as multicols.

\newcommand\appendix{\par
\setcounter{chapter}{0}\
\setcounter{section}{0}\
\gdef\@chapapp{\appendixname}\
\gdef\thechapter{@Alph\c@chapter}}

7.5 Setting parameters for existing environments

7.5.1 Array and tabular

\arraycolsep The columns in an array environment are separated by 2\arraycolsep.
\setlength{\arraycolsep}{5\p@}

\tabcolsep The columns in an tabular environment are separated by 2\tabcolsep.
\setlength{\tabcolsep}{6\p@}
The width of rules in the array and tabular environments is given by \arrayrulewidth.\arrayrulewidth
\doublerulesep The space between adjacent rules in the array and tabular environments is given by \doublerulesep.\doublerulesep

7.5.2 Tabbing
\tabbingsep This controls the space that the \' command puts in. (See \LaTeX manual for an explanation.)\tabbingsep

7.5.3 Minipage
\minipagerestore The macro \minipagerestore is called upon entry to a minipage environment to set up things that are to be handled differently inside a minipage environment. In the current classes, it does nothing.\minipagerestore
\mpfootins Minipages have their own footnotes; \skip\mpfootins plays same rôle for footnotes in a minipage as \skip\footins does for ordinary footnotes.\mpfootins

7.5.4 Framed boxes
\fboxsep The space left by \fbox and \framebox between the box and the text in it.\fboxsep
\fboxrule The width of the rules in the box made by \fbox and \framebox.\fboxrule

7.5.5 Equation and eqnarray
\theequation When within chapters, the equation counter will be reset at the beginning of a new chapter and the equation number will be prefixed by the chapter number. This code must follow the \chapter definition or, more exactly, the definition of the chapter counter.\theequation
\jot \jot is the extra space added between lines of an eqnarray environment. The default value is used.\jot
\eqnnum The macro \eqnnum defines how equation numbers are to appear in equations. Again the default is used.\eqnnum

7.6 Floating objects

The \LaTeX format only defines a number of tools with which floating objects can be defined. This is done in the document class. It needs to define the following macros for each floating object of type TYPE (e.g., TYPE = figure).

\texttt{\textbackslash fps@TYPE} The default placement specifier for floats of type TYPE.

\texttt{\textbackslash ftype@TYPE} The type number for floats of type TYPE. Each TYPE has associated a unique positive TYPE number, which is a power of two. E.g., figures might have type number 1, tables type number 2, programs type number 4, etc.

\texttt{\textbackslash ext@TYPE} The file extension indicating the file on which the contents list for float type TYPE is stored. For example, \texttt{\textbackslash ext@figure} = ‘lof’.

\texttt{\textbackslash fnum@TYPE} A macro to generate the figure number for a caption. For example, \texttt{\textbackslash fnum@TYPE} == ‘Figure \thefigure’.

\texttt{\textbackslash @makecaption\langle num\rangle\langle text\rangle} A macro to make a caption, with \langle num\rangle the value produced by \texttt{\textbackslash fnum@...} and \langle text\rangle the text of the caption. It can assume it’s in a \texttt{\parbox} of the appropriate width. This will be used for all floating objects.

The actual environment that implements a floating object such as a figure is defined using the macros \texttt{\textbackslash @float} and \texttt{\textbackslash end@float}, which are defined in the \LaTeX format.

An environment that implements a single-column floating object is started with \texttt{\textbackslash @float\{TYPE\}\langle placement\rangle} of type TYPE with \langle placement\rangle as the placement specifier. The default value of \langle PLACEMENT\rangle is defined by \texttt{\textbackslash fps@TYPE}.

The environment is ended by \texttt{\textbackslash end@float}. E.g., \texttt{\textbackslash figure == \textbackslash @floatfigure, \textbackslash endfigure == \textbackslash end@float}.

7.6.1 Figure

Here is the implementation of the figure environment.

\texttt{\textbackslash c@figure} First we have to allocate a counter to number the figures.

In the report and book document classes figures within chapters are numbered per chapter.

\begin{verbatim}
1075 \newcounter{figure}
1076 \renewcommand{\bfseries \thefigure}{\arabic{c@figure}}
1077 \endverbatim

\texttt{\textbackslash fps@figure} Here are the parameters for the floating objects of type ‘figure’.

\begin{verbatim}
1084 \def\fps@figure{tbp}
1085 \def\ftype@figure{1}
1086 \def\ext@figure{lof}
1087 \def\fnnum@figure{\figurename\nobreak\space\bf

42
7.6.2 Table

Here is the implementation of the table environment. It is very much the same as
the figure environment.

\c@table First we have to allocate a counter to number the tables.

In the report and book document classes tables within chapters are numbered
per chapter.

\fps@table Here are the parameters for the floating objects of type ‘table’.

\ftype@table 1103 \def\fps@table{tbp}
\ext@table 1104 \def\ftype@table{2}
\num@table 1105 \def\ext@table{lot}
1106 \def\fnum@table{\tablename \nobreakspace \thetable}

\caption command calls \@makecaption to format the caption of floating
objects. It gets two arguments, \langle number\rangle, the number of the floating object and
\langle text\rangle, the text of the caption. Usually \langle number\rangle contains a string such as ‘Figure
3.2’. The macro can assume it is called inside a \parbox of right width, with
\normalsize.

\abovecaptionskip These lengths contain the amount of white space to leave above and below the
\belowcaptionskip caption.
\long\def\@makecaption#1#2{\vskip\abovecaptionskip
We want to see if the caption fits on one line on the page, therefore we first typeset it in a temporary box.
\sbox\@tempboxa{#1: #2}\
We can the measure its width. It that is larger than the current \hsize we typeset the caption as an ordinary paragraph.
\ifdim \wd\@tempboxa >\hsize
#1: #2\par
If the caption fits, we center it. Because this uses an \hbox directly in vertical mode, it does not execute the \everypar tokens; the only thing that could be needed here is resetting the ‘minipage flag’ so we do this explicitly.
\else
\global \@minipagefalse
\hb@xt\hsize{\hfil\box\@tempboxa\hfil}\
\fi
\vskip\belowcaptionskip}

7.7 Font changing

Here we supply the declarative font changing commands that were common in \LaTeX{} version 2.09 and earlier. These commands work in text mode \textit{and} in math mode. They are provided for compatibility, but one should start using the \textit{...} and \mathit... commands instead. These commands are defined using \DeclareTextFontCommand, a command with three arguments: the user command to be defined; \LaTeX{} commands to execute in text mode and \LaTeX{} commands to execute in math mode.

\texttt{\textsf{\textit{\textbf{\textsc{\textbackslash rm}}}}}
The commands to change the family. When in compatibility mode we select the ‘default’ font first, to get \LaTeX{}2.09 behaviour.
\texttt{\textsf{\textit{\textbf{\textsc{\textbackslash sf}}}}}
The command to change to the bold series. One should use \texttt{\textit{\textbf{\textsc{\texttt{\textbf{\textit{\textbf{\textsc{\textbackslash bf}}}}}}}}\textit{\textbf{\textsc{\texttt{\textbf{\textit{\textbf{\textsc{\texttt{\textbf{\textit{\textbf{\textsc{\textbackslash sf}}}}}}}}}}}}\textit{\textbf{\textsc{\texttt{\textbf{\textit{\textbf{\textsc{\texttt{\textbf{\textit{\textbf{\textsc{\textbackslash rm}}}}}}}}}}}}} to explicitly switch back to medium series.
\texttt{\textsf{\textit{\textbf{\textsc{\textbackslash sl}}}}}
The commands to change the shape of the font. The slanted and small caps \texttt{\textit{\textbf{\textsc{\texttt{\textbf{\textit{\textbf{\textsc{\texttt{\textbf{\textit{\textbf{\textsc{\textbackslash sl}}}}}}}}}}}}\textit{\textbf{\textsc{\texttt{\textbf{\textit{\textbf{\textsc{\texttt{\textbf{\textit{\textbf{\textsc{\textbackslash it}}}}}}}}}}}}}\textit{\textbf{\textsc{\texttt{\textbf{\textit{\textbf{\textsc{\texttt{\textbf{\textit{\textbf{\textsc{\textbackslash st}}}}}}}}}}}}} shapes are not available by default as math alphabets, so those changes do nothing in math mode. However, we do warn the user that the selection will not have any effect. One should use \texttt{\textit{\textbf{\textsc{\texttt{\textbf{\textit{\textbf{\textsc{\texttt{\textbf{\textit{\textbf{\textsc{\textbackslash sl}}}}}}}}}}}}\textit{\textbf{\textsc{\texttt{\textbf{\textit{\textbf{\textsc{\texttt{\textbf{\textit{\textbf{\textsc{\textbackslash it}}}}}}}}}}}}} to explicitly change back to the upright shape.
The commands \cal and \mit should only be used in math mode, outside math mode they have no effect. Currently the New Font Selection Scheme defines these commands to generate warning messages. Therefore we have to define them ‘by hand’.

\begin{Verbatim}
\newcommand*{\cal}{\@fontswitch\relax\mathcal}
\newcommand*{\mit}{\@fontswitch\relax\mathnormal}
\end{Verbatim}

8 Cross Referencing

8.1 Table of Contents, etc.

A \section command writes a \contentsline{section}{⟨title⟩}{⟨page⟩} command on the .toc file, where ⟨title⟩ contains the contents of the entry and ⟨page⟩ is the page number. If sections are being numbered, then ⟨title⟩ will be of the form \numberline{⟨num⟩}{⟨heading⟩} where ⟨num⟩ is the number produced by \thesection. Other sectioning commands work similarly.

A \caption command in a ‘figure’ environment writes \contentsline{figure}{\numberline{⟨num⟩}{⟨caption⟩}}{⟨page⟩} on the .lof file, where ⟨num⟩ is the number produced by \thefigure and ⟨caption⟩ is the figure caption. It works similarly for a ‘table’ environment.

The command \contentsline{⟨name⟩} expands to \l@⟨name⟩. So, to specify the table of contents, we must define \l@chapter, \l@section, \l@subsection, ... ; to specify the list of figures, we must define \l@figure; and so on. Most of these can be defined with the \dottedtocline command, which works as follows.

\begin{Verbatim}
\dottedtocline{⟨level⟩}{⟨indent⟩}{⟨numwidth⟩}{⟨title⟩}{⟨page⟩}
\end{Verbatim}

⟨level⟩ An entry is produced only if ⟨level⟩ ≤ value of the tocdepth counter. Note, \chapter is level 0, \section is level 1, etc.

⟨indent⟩ The indentation from the outer left margin of the start of the contents line.

⟨numwidth⟩ The width of a box in which the section number is to go, if ⟨title⟩ includes a \numberline command.

\begin{Verbatim}
\newcommand*{\pnumwidth}{1.55em}
\newcommand*{\tocrmarg}{2.55em}
\newcommand*{\dotsep}{4.5}
\end{Verbatim}

\begin{Verbatim}
\newcommand*{\pnumwidth}{1.55em}
\newcommand*{\tocrmarg}{2.55em}
\newcommand*{\dotsep}{4.5}
\end{Verbatim}
8.1.1 Table of Contents

\tableofcontents

This macro is used to request that \LaTeX{} produces a table of contents. In the report and book document classes the tables of contents, figures etc. are always set in single-column mode.

\newcommand{\tableofcontents}{% 
  \if@twocolumn
    \@restonecoltrue\onecolumn
  \else
    \@restonecolfalse
  \fi

  The title is set using the \chapter* command, making sure that the running head–if one is required–contains the right information.

  \chapter*{\contentsname}

  The code for \@maketitle is placed inside the heading to avoid any influence on vertical spacing after the heading (in some cases). For other commands, such as \listoffigures below this has been changed from the \LaTeX{}2.09 version as it will produce a serious bug if used in two-column mode (see, pr/3285). However, \tableofcontents is always typeset in one-column mode in these classes, therefore the somewhat inconsistent setting has been retained for compatibility reasons.

\@maketitle

The actual table of contents is made by calling \@starttoc{toc}. After that we restore two-column mode if necessary.

\@starttoc{toc}

Each sectioning command needs an additional macro to format its entry in the table of contents, as described above. The macro for the entry for parts is defined in a special way.

First we make sure that if a pagebreak should occur, it occurs before this entry. Also a little whitespace is added and a group begun to keep changes local.

\newcommand{\l@part}{% 
  \ifnum \c@tocdepth > -2 \relax
    \addpenalty{-\@highpenalty}
    \addvspace{2.25em \@plus\p@}
  \fi

  \numberline requires that the width of the box that holds the part number is stored in \LaTeX{}’s scratch register \@tempdima. Therefore we initialize it there even though we do not use \numberline internally—the value used is quite large so that something like \numberline{I} would still work.

\setlength{\@tempdima}{3em}
\begingroup
We set \parindent to 0pt and use \rightskip to leave enough room for the page numbers.\footnote{We should really set \rightskip to \@tocmarg instead of \@pnumwidth (no version of \LaTeX{} ever did this), otherwise the \rightskip is too small. Unfortunately this can't be changed in \LaTeX{} as we don't want to create different versions of \LaTeX{} which produce different typeset output unless this is absolutely necessary; instead we suspend it for \LaTeX{}3.} To prevent overfull box messages the \parfillskip is set to a negative value.

\begin{verbatim}
\parindent \z@ \rightskip \@pnumwidth
\parfillskip -\@pnumwidth
\end{verbatim}

Now we can set the entry, in a large bold font. We make sure to leave vertical mode, set the part title and add the page number, set flush right.

\begin{verbatim}
\leavevmode
\large \bfseries #1\hfil
\hb@xt\@pnumwidth{\hss #2%}
\kern-\p@\kern\p@}
\end{verbatim}

Prevent a pagebreak immediately after this entry, but use \everypar to reset the \if@nobreak switch. Finally we close the group.

\begin{verbatim}
\nobreak
\langle\if@compatibility
\global\@nobreaktrue
\everypar{\global\@nobreakfalse\everypar{}}\fi\rangle
\endgroup
\end{verbatim}

\l@chapter
This macro formats the entries in the table of contents for chapters. It is very similar to \l@part.

First we make sure that if a pagebreak should occur, it occurs \textit{before} this entry. Also a little whitespace is added and a group begun to keep changes local.

\begin{verbatim}
\newcommand*{\l@chapter}[2]{%\ifnum \c@tocdepth >\m@ne
\addpenalty{-\@highpenalty}%
\setlength\@tempdima{1.5em}%
\begingroup
\parindent \z@ \rightskip \@pnumwidth
\parfillskip -\@pnumwidth
\leavevmode \bfseries
\because we do not use \numberline here, we have do some fine tuning 'by hand', before we can set the entry. We discourage but not disallow a pagebreak immediately after a chapter entry.

\l@$chapter$

\end{verbatim}
In the article document class the entry in the table of contents for sections looks much like the chapter entries for the report and book document classes.

First we make sure that if a pagebreak should occur, it occurs before this entry. Also a little whitespace is added and a group begun to keep changes local.

The macro \numberline requires that the width of the box that holds the part number is stored in \LaTeX's scratch register \@tempdima. Therefore we put it there. We begin a group, and change some of the paragraph parameters (see also the remark at \l@part regarding \rightskip).

Then we leave vertical mode and switch to a bold font.

Because we do not use \numberline here, we have do some fine tuning 'by hand', before we can set the entry. We discourage but not disallow a pagebreak immediately after a chapter entry.

In the report and book document classes the definition for \l@section is much simpler.

All lower level entries are defined using the macro \@dottedtocline (see above).
8.1.2 List of figures

This macro is used to request that \LaTeX produces a list of figures. It is very similar to \tableofcontents.

\listoffigures This macro produces an entry in the list of figures.

\l@figure This macro produces an entry in the list of figures.

8.1.3 List of tables

This macro is used to request that \LaTeX produces a list of tables. It is very similar to \tableofcontents.

\listoftables This macro produces an entry in the list of tables.
8.2 Bibliography

The “open” bibliography format uses an indentation of \bibindent.
\newdimen\bibindent
\setlength\bibindent{1.5em}

The \texttt{thebibliography} environment executes the following commands:
\renewcommand{\newblock}{\hskip.11em @plus.33em @minus.07em}
— Defines the “closed” format, where the blocks (major units of information) of an entry run together.
\sloppy — Used because it’s rather hard to do line breaks in bibliographies,
\sfcode’.=1000\relax — Causes a ‘.’ (period) not to produce an end-of-sentence space.

The implementation of this environment is based on the generic list environment. It uses the \texttt{enumiv} counter internally to generate the labels of the list.

When an empty ‘thebibliography’ environment is found, a warning is issued.
\newblock The default definition for $\newblock$ is to produce a small space.

The default definition for $\@openbib@code$ is to do nothing. It will be changed by the $\openbib$ option.

The label for a $\bibitem[...]$ command is produced by this macro. The default from the $\LaTeX$ format is used.

The output of the $\cite$ command is produced by this macro. The default from the $\LaTeX$ format is used.

8.3 The index

The environment ‘theindex’ can be used for indices. It makes an index with two columns, with each entry a separate paragraph. At the user level the commands $\item$, $\subitem$ and $\subsubitem$ are used to produce index entries of various levels. When a new letter of the alphabet is encountered an amount of

$\indexspace$ white space can be added.

Parameter changes to $\columnseprule$ and $\columnsep$ have to be done after $\twocolumn$ has acted. Otherwise they can affect the last page before the index.

When the document continues after the index and it was a one-column document we have to switch back to one column after the index.

These macros are used to format the entries in the index.

The amount of white space that is inserted between ‘letter blocks’ in the index.
8.4 Footnotes

Footnotes are numbered within chapters in the report and book document classes.

Footnotes are separated from the main body of the text by a small rule.
This rule is drawn by the macro \footnoterule. We have to make sure that the
rule takes no vertical space (see plain.tex) so we compensate for the natural
height of the rule of 0.4pt by adding the right amount of vertical skip.
To prevent the rule from colliding with the footnote we first add a little negative
vertical skip, then we put the rule and make sure we end up at the same point
where we began this operation.

\renewcommand\footnoterule{\kern-3\p@\hrule\@width.4\columnwidth\kern2.6\p@}

Footnotes are numbered within chapters in the report and book document classes.

The footnote mechanism of \LaTeX calls the macro \@makefntext to produce the
actual footnote. The macro gets the text of the footnote as its argument and
should use \@thefnmark as the mark of the footnote. The macro \@makefntext is
called when effectively inside a \parbox of width \columnwidth (i.e., with \hsize
= \columnwidth).
An example of what can be achieved is given by the following piece of \TeX code.

\newcommand\@makefntext[1]{\@setpar\@par
\@tempdima = \hsize
\advance\@tempdima-10pt
\parshape \@ne 10pt \@tempdima\%
\par
\parindent 1em\@noindent
\hbox to \@z\@{(\@makefnmark)\#1}}

The effect of this definition is that all lines of the footnote are indented by 10pt,
while the first line of a new paragraph is indented by 1em. To change these
dimensions, just substitute the desired value for ‘10pt’ (in both places) or ‘1em’.
The mark is flushright against the footnote.

In these document classes we use a simpler macro, in which the footnote text
is set like an ordinary text paragraph, with no indentation except on the first line
of a paragraph, and the first line of the footnote. Thus, all the macro must do is
set \parindent to the appropriate value for succeeding paragraphs and put the
proper indentation before the mark.

\newcommand\@makefntext[1]{\parindent 1em\@noindent
\hb@xt@1.8em{(\@makefnmark)\#1}}

The footnote markers that are printed in the text to point to the footnotes should
be produced by the macro \@makefnmark. We use the default definition for it.

\renewcommand\@makefnmark{\ifcase\@footnotemark
\@textsuperscript{\normalfont\@thefnmark}\or
\normalfont\@thefnmark\fi}
9 Initialization

9.1 Words

This document class is for documents prepared in the English language. To prepare a version for another language, various English words must be replaced. All the English words that require replacement are defined below in command names. These commands may be redefined in any class or package that is customising \LaTeX{} for use with non-English languages.

\begin{verbatim}
\newcommand{contentsname}{Contents}
\newcommand{listfigurename}{List of Figures}
\newcommand{listtablename}{List of Tables}
\newcommand{refname}{References}
\newcommand{bibname}{Bibliography}
\newcommand{indexname}{Index}
\newcommand{figurename}{Figure}
\newcommand{tablename}{Table}
\newcommand{partname}{Part}
\newcommand{chaptername}{Chapter}
\newcommand{appendixname}{Appendix}
\newcommand{abstractname}{Abstract}
\end{verbatim}

9.2 Date

\begin{verbatim}
\def{today}{\ifcase\month\or January\or February\or March\or April\or May\or June\or July\or August\or September\or October\or November\or December\fi \space \number\day, \number\year}
\end{verbatim}

9.3 Two-column mode

\begin{verbatim}
\columnsep This gives the distance between two columns in two-column mode.
\setlength{\columnsep}{10\p@}
\columnseprule This gives the width of the rule between two columns in two-column mode. We have no visible rule.
\setlength{\columnseprule}{0\p@}
\end{verbatim}
9.4 The page style

We have plain pages in the document classes article and report unless the user specified otherwise. In the ‘book’ document class we use the page style headings by default. We use arabic page numbers.

\pagestyle{plain}  \pagestyle{headings}  \pagenumbering{arabic}

9.5 Single or double sided printing

When the twoside option wasn’t specified, we don’t try to make each page as long as all the others.

\if@twoside
  \raggedbottom
\fi

When the twocolumn option was specified we call \twocolumn to activate this mode. We try to make each column as long as the others, but call \sloppy to make our life easier.

\if@twocolumn
  \twocolumn  \sloppy  \flushbottom
\fi

Normally we call \onecolumn to initiate typesetting in one column.

\else
  \onecolumn
\fi

Index

Numbers written in italic refer to the page where the corresponding entry is described; numbers underlined refer to the code line of the definition; numbers in roman refer to the code lines where the entry is used.
