1 The docstrip modules

The following modules are used in the implementation to direct docstrip in generating the external files:

- article produce the documentclass article
- report produce the documentclass report
- size10 produce the class option for 10pt
- size11 produce the class option for 11pt
- size12 produce the class option for 12pt
- book produce the documentclass book
- bk10 produce the book class option for 10pt
- bk11 produce the book class option for 11pt
- bk12 produce the book class option for 12pt
- driver produce a documentation driver file

2 Initial Code

In this part we define a few commands that are used later on.

\@ptsize This control sequence is used to store the second digit of the pointsize we are typesetting in. So, normally, it’s value is one of 0, 1 or 2.
1 (*article | report | book)
2 \newcommand\@ptsize{}

\if@restonecol When the document has to be printed in two columns, we sometimes have to temporarily switch to one column. This switch is used to remember to switch back.
3 \newif\if@restonecol

\if@titlepage A switch to indicate if a titlepage has to be produced. For the article document class the default is not to make a separate titlepage.
4 \newif\if@titlepage
5 \if\@titlepagefalse
6 \if\@titlepagetrue

\if@openright A switch to indicate if chapters must start on a right-hand page. The default for the report class is no; for the book class it’s yes.
7 \if\@openright

\if@mainmatter The switch \if@mainmatter, only available in the document class book, indicates whether we are processing the main material in the book.
8 \if\@mainmatter \@mainmattertrue
3 Declaration of Options

3.1 Setting Paper Sizes

The variables \paperwidth and \paperheight should reflect the physical paper size after trimming. For desk printer output this is usually the real paper size since there is no post-processing. Classes for real book production will probably add other paper sizes and additionally the production of crop marks for trimming. In compatibility mode, these (and some of the subsequent) options are disabled, as they were not present in \LaTeX{}2.09.

\begin{verbatim}
9 \if@compatibility\else
10 \DeclareOption{a4paper}
11 {\setlength\paperheight {297mm} %
12 \setlength\paperwidth {210mm}}
13 \DeclareOption{a5paper}
14 {\setlength\paperheight {210mm} %
15 \setlength\paperwidth {148mm}}
16 \DeclareOption{b5paper}
17 {\setlength\paperheight {250mm} %
18 \setlength\paperwidth {176mm}}
19 \DeclareOption{letterpaper}
20 {\setlength\paperheight {11in} %
21 \setlength\paperwidth {8.5in}}
22 \DeclareOption{legalpaper}
23 {\setlength\paperheight {14in} %
24 \setlength\paperwidth {8.5in}}
25 \DeclareOption{executivepaper}
26 {\setlength\paperheight {10.5in} %
27 \setlength\paperwidth {7.25in}}
28 \fi

The option landscape switches the values of \paperheight and \paperwidth, assuming the dimensions were given for portrait paper.

29 \DeclareOption{landscape}
30 {\setlength\@tempdima {\paperheight} %
31 \setlength\paperheight {\paperwidth} %
32 \setlength\paperwidth {\@tempdima}}
33 \fi

3.2 Choosing the type size

The type size options are handled by defining \@ptsize to contain the last digit of the size in question and branching on \ifcase statements. This is done for historical reasons to stay compatible with other packages that use the \@ptsize variable to select special actions. It makes the declarations of size options less than 10pt difficult, although one can probably use 9 and 8 assuming that a class won't define both 8pt and 10pt options.

\begin{verbatim}
33 \if@compatibility
34 \renewcommand\@ptsize{0}
35 \else
36 \DeclareOption{10pt}{\renewcommand\@ptsize{0}}
37 \fi
38 \DeclareOption{11pt}{\renewcommand\@ptsize{1}}
39 \DeclareOption{12pt}{\renewcommand\@ptsize{2}}
\end{verbatim}
3.3 Two-side or one-side printing
For two-sided printing we use the switch \if@twoside. In addition we have to set the \if@mparswitch to get any margin paragraphs into the outside margin.
\if@compatibility\else
\DeclareOption{oneside}{\@twosidefalse \@mparswitchfalse}
\fi
\DeclareOption{twoside}{\@twosidetrue \@mparswitchtrue}

3.4 Draft option
If the user requests draft we show any overfull boxes. We could probably add some more interesting stuff to this option.
\DeclareOption{draft}{\setlength\overfullrule{5pt}}
\if@compatibility\else
\DeclareOption{final}{\setlength\overfullrule{0pt}}
\fi

3.5 Titlepage option
An article usually has no separate titlepage, but the user can request one.
\DeclareOption{titlepage}{\@titlepagetrue}
\if@compatibility\else
\DeclareOption{notitlepage}{\@titlepagefalse}
\fi

3.6 openright option
This option determines whether or not a chapter must start on a right-hand page request one.
(\if@compatibility\else
\DeclareOption{openright}{\@openrighttrue}
\fi
\DeclareOption{openany}{\@openrightfalse}

3.7 Twocolumn printing
Two-column and one-column printing is again realized via a switch.
\if@compatibility\else
\DeclareOption{onecolumn}{\@twocolumnfalse}
\fi
\DeclareOption{twocolumn}{\@twocolumntrue}

3.8 Equation numbering on the left
The option leqno can be used to get the equation numbers on the left side of the equation. It loads code which is generated automatically from the kernel files when the format is built. If the equation number does get a special formatting
then instead of using the kernel file the class would need to provide the code explicitly.

\DeclarationsOption{leqno}{\input{leqno.clo}}

### 3.9 Flush left displays

The option `fleqn` redefines the displayed math environments in such a way that they come out flush left, with an indentation of \mathindent from the prevailing left margin. It loads code which is generated automatically from the kernel files when the format is built.

\DeclarationsOption{fleqn}{\input{fleqn.clo}}

### 3.10 Open bibliography

The option `openbib` produces the “open” bibliography style, in which each block starts on a new line, and succeeding lines in a block are indented by \bibindent.

\DeclarationsOption{openbib}{
First some hook into the bibliography environment is filled.
\AtEndOfPackage{
\renewcommand\@openbib@code{
\advance\leftmargin\bibindent
\itemindent -\bibindent
\listparindent \itemindent
\parsep \z@}
}
In addition the definition of `\newblock` is overwritten.
\renewcommand\newblock{\par}}

### 4 Executing Options

Here we execute the default options to initialize certain variables. Note that the document class `book` always uses two sided printing.

\ExecuteOptions{letterpaper,10pt,oneside,onecolumn,final}
\ExecuteOptions{letterpaper,10pt,oneside,onecolumn,final,openany}
\ExecuteOptions{letterpaper,10pt,twoside,onecolumn,final,openright}

The `\ProcessOptions` command causes the execution of the code for every option FOO which is declared and for which the user typed the FOO option in his `\documentclass` command. For every option BAR he typed, which is not declared, the option is assumed to be a global option. All options will be passed as document options to any `\usepackage` command in the document preamble.
Now that all the options have been executed we can load the chosen class option file that contains all size dependent code.

84 ⟨book⟩\input{size1@ptsize.clo}
85 ⟨book⟩\input{bk1@ptsize.clo}
86 ⟨/article|report|book⟩

5  Loading Packages

The standard class files do not load additional packages.

6  Document Layout

In this section we are finally dealing with the nasty typographical details.

6.1  Fonts

\LaTeX{} offers the user commands to change the size of the font, relative to the ‘main’ size. Each relative size changing command \texttt{\textbackslash size} executes the command \texttt{\@setfontsize\texttt{size}(font-size)(baselineskip)} where:

\texttt{\textbackslash font-size} The absolute size of the font to use from now on.

\texttt{\textbackslash baselineskip} The normal value of \texttt{\baselineskip} for the size of the font selected. (The actual value will be \texttt{\baselinestretch \* (baselineskip).})

A number of commands, defined in the \LaTeX{} kernel, shorten the following definitions and are used throughout. They are:

\texttt{\@vpt} 5 \texttt{\@vipt} 6 \texttt{\@viipt} 7 \texttt{\@viiipt} 8 \texttt{\@ixpt} 9 \texttt{\@xpt} 10 \texttt{\@xipt} 10.95 \texttt{\@xiipt} 12 \texttt{\@xivpt} 14.4

\texttt{\textbackslash normalsize} The user level command for the main size is \texttt{\normalsize}. Internally \LaTeX{} uses \texttt{\@normalsize} when it refers to the main size. \texttt{\@normalsize} will be defined to work like \texttt{\normalsize} if the latter is redefined from its default definition (that just issues an error message). Otherwise \texttt{\@normalsize} simply selects a 10pt/12pt size.

The \texttt{\normalsize} macro also sets new values for \texttt{\abovedisplayskip}, \texttt{\abovedisplayshortskip} and \texttt{\belowdisplayshortskip}.

87 (*10pt|11pt|12pt)
88 \renewcommand\normalsize{%
89 (*10pt)
90 \@setfontsize\normalsize\@xipt\@xiipt
91 \abovedisplayskip 10\p@ \@plus2\p@ \@minus5\p@
92 \abovedisplayshortskip \z@ \@plus3\p@
93 \belowdisplayshortskip 6\p@ \@plus3\p@ \@minus3\p@
94 (/10pt)
95 (*11pt)
96 \@setfontsize\normalsize\@xipt{13.6}\%
97 \abovedisplayskip 11\p@ \@plus3\p@ \@minus6\p%
The \belowdisplayskip is always equal to the \abovedisplayskip. The parameters of the first level list are always given by \@listI.

We initially choose the normalsize font.

\texttt{\let\@listi\@listI}

We use \texttt{\MakeRobust} instead of \texttt{\DeclareRobustCommand} above to avoid a log entry for the redefinition.

\texttt{\MakeRobust\normalsize}

\texttt{\small}

This is similar to \texttt{\normalsize}.

\texttt{\DeclareRobustCommand\small{\setfontsize\small\@ixpt{11}\abovedisplayskip 8.5\p@ \plus3\p@ \minus4\p@ \abovedisplayshortskip 12\p@ \plus3\p@ \minus7\p@ \belowdisplayshortskip 4\p@ \plus2\p@ \minus2\p@ \def\@listi{\leftmargin\leftmargini\topsep 4\p@ \plus2\p@ \minus2\p@ \parsep 2\p@ \plus\p@ \minus\p@ \itemsep \parsep}}\normalsize}
\footnotesize This is similar to \normalsize.

\DeclareRobustCommand\footnotesize{%
  \@setfontsize\footnotesize\@viiipt{9.5}%
  \abovedisplayskip 6\p@ \@plus2\p@ \@minus4\p@
  \abovedisplayshortskip \z@ \@plus\p@
  \belowdisplayshortskip 3\p@ \@plus\p@ \@minus2\p@
  \def\@listi\{\leftmargin\leftmargini
  \topsep 3\p@ \@plus2\p@ \@minus\p@\itemsep \parsep}%

\scriptsize
\tiny
\large
\Large
\LARGE
\huge
\Huge

These are all much simpler than the previous macros, they just select a new
fontsize, but leave the parameters for displays and lists alone.

\DeclareRobustCommand\scriptsize{%
  \@setfontsize\scriptsize\@viiipt\@viiipt

\DeclareRobustCommand\tiny{%
  \@setfontsize\tiny\@vpt\@vipt

\DeclareRobustCommand\large{%
  \@setfontsize\large\@xiipt{14}

\DeclareRobustCommand\Large{%
  \@setfontsize\Large\@xivpt{18}

\DeclareRobustCommand\LARGE{%
  \@setfontsize\LARGE\@xviipt{22}

\DeclareRobustCommand\huge{%
  \@setfontsize\huge\@xxpt{25}

\DeclareRobustCommand\Huge{%
  \@setfontsize\Huge\@xxvpt{30}

\DeclareRobustCommand\scriptsize{%
  \@setfontsize\scriptsize\@viiipt\@viiipt

\DeclareRobustCommand\tiny{%
  \@setfontsize\tiny\@vpt\@vipt

\DeclareRobustCommand\large{%
  \@setfontsize\large\@xiipt{14}

\DeclareRobustCommand\Large{%
  \@setfontsize\Large\@xivpt{18}

\DeclareRobustCommand\LARGE{%
  \@setfontsize\LARGE\@xviipt{22}

\DeclareRobustCommand\huge{%
  \@setfontsize\huge\@xxpt{25}

\DeclareRobustCommand\Huge{%
  \@setfontsize\Huge\@xxvpt{30}

\DeclareRobustCommand\scriptsize{%
  \@setfontsize\scriptsize\@viiipt\@viiipt

\DeclareRobustCommand\tiny{%
  \@setfontsize\tiny\@vpt\@vipt

\DeclareRobustCommand\large{%
  \@setfontsize\large\@xiipt{14}

\DeclareRobustCommand\Large{%
  \@setfontsize\Large\@xivpt{18}
\lineskip These parameters control \TeX{}'s behaviour when two lines tend to come too close together.
\normallineskip
\baselinestretch This is used as a multiplier for \baselineskip. The default is to not stretch the baselines. Note that if this command doesn’t resolve to “empty” any plus or minus part in the specification of \baselineskip is ignored.
\parskip \parindent gives extra vertical space between paragraphs and \parindent is the width of the paragraph indentation. The value of \parindent depends on whether we are in two column mode.
\smallskipamount \medskipamount \bigskipamount The values for these three parameters are set in the \LaTeX{} kernel. They should perhaps vary, according to the size option specified. But as they have always had the same value regardless of the size option we do not change them to stay compatible with both \LaTeX{} 2.09 and older releases of \LaTeX{} 2ε.
The commands \nopagebreak and \nolinebreak put in penalties to discourage these breaks at the point they are put in. They use \@lowpenalty, \@medpenalty or \@highpenalty, dependent on their argument.

\clubpenalty \widowpenalty These penalties are use to discourage club and widow lines. Because we use their default values we only show them here, commented out.

\displaywidowpenalty \predisplaypenalty \postdisplaypenalty Discourage (but not so much) widows in front of a math display and forbid breaking directly in front of a display. Allow break after a display without a penalty. Again the default values are used, therefore we only show them here.

\interlinepenalty Allow the breaking of a page in the middle of a paragraph.

\brokenpenalty We allow the breaking of a page after a hyphenated line.

6.3 Page Layout

All margin dimensions are measured from a point one inch from the top and lefthand side of the page.

6.3.1 Vertical spacing

\headheight The \headheight is the height of the box that will contain the running head. The \headsep is the distance between the bottom of the running head and the top of the text. The \topskip is the \baselineskip for the first line on a page; \LaTeX’s output routine will not work properly if it has the value 0pt, so do not do that!

\footskip The distance from the baseline of the box which contains the running footer to the baseline of last line of text is controlled by the \footskip.
The \TeX{} primitive register \texttt{\maxdepth} has a function that is similar to that of \texttt{\topskip}. The register \texttt{\@maxdepth} should always contain a copy of \texttt{\maxdepth}. This is achieved by setting it internally at \texttt{\begin{document}}. In both plain \TeX{} and \LaTeX{} 2.09 \texttt{\maxdepth} had a fixed value of 4pt; in native \LaTeX{} 2e mode we let the value depend on the typesize. We set it so that \texttt{\maxdepth + \topskip = typesize \times 1.5}. As it happens, in these classes \texttt{\topskip} is equal to the typesize, therefore we set \texttt{\maxdepth} to half the value of \texttt{\topskip}.

\if@compatibility \setlength{\maxdepth}{4\p@} \else \setlength{\maxdepth}{.5\topskip} \fi

6.3.2 The dimension of text

\texttt{\textwidth} When we are in compatibility mode we have to make sure that the dimensions of the printed area are not different from what the user was used to see.

\if@compatibility \if@twocolumn \setlength{\textwidth}{410\p@} \else \setlength{\textwidth}{345\p@} \setlength{\textwidth}{360\p@} \setlength{\textwidth}{390\p@} \fi \else \setlength{\textwidth}{4.5in} \setlength{\textwidth}{5in} \setlength{\textwidth}{5in} \fi

When we are not in compatibility mode we can set some of the dimensions differently, taking into account the paper size for instance.

\else
First, we calculate the maximum \texttt{\textwidth}, which we will allow on the selected paper and store it in \texttt{\@tempdima}. Then we store the length of a line with approximately 60–70 characters in \texttt{\@tempdimb}. The values given are more or less suitable when Computer Modern fonts are used.

\setlength{\@tempdima}{\paperwidth}
\addtolength{\@tempdima}{-2in}
\setlength{\@tempdimb}{345\p@}
\setlength{\@tempdimb}{360\p@}
\setlength{\@tempdimb}{390\p@}
\setlength{\@tempdimb}{4.5\in}
\setlength{\@tempdimb}{5\in}
\setlength{\@tempdimb}{5\in}
\fi

Now we can set the \texttt{\textwidth}, depending on whether we will be setting one or two columns.

In two column mode each \texttt{column} shouldn’t be wider than \texttt{\@tempdimb} (which could happen on A3 paper for instance).

\if@twocolumn \ifdim\@tempdima>2\@tempdimb\relax \setlength{\textwidth}{2\@tempdimb} \else \setlength{\textwidth}{\@tempdima} \fi \fi
In one column mode the text should not be wider than the minimum of the
paperwidth (minus 2 inches for the margins) and the maximum length of a line as
defined by the number of characters.

\begin{verbatim}
\if\@compatibility\else
\ifdim\@tempdima>\@tempdimb\relax
\setlength\textwidth{\@tempdimb}
\else
\setlength\textwidth{\@tempdima}
\fi
\fi
\fi
\end{verbatim}

Here we modify the width of the text a little to be a whole number of points.

\begin{verbatim}
\if\@compatibility\else
\@settopoint\textwidth
\fi
\end{verbatim}

\textwidth
Now that we have computed the width of the text, we have to take care of the
height. The \textwidth is the height of text (including footnotes and figures,
excluding running head and foot).

First make sure that the compatibility mode gets the same dimensions as we
had with \LaTeX2.09. The number of lines was calculated as the floor of the old
\textwidth minus \topskip, divided by \baselineskip for \normalsize. The
old value of \textwidth was 528pt.

\begin{verbatim}
\if\@compatibility
\langle 10pt \&!bk \rangle \setlength\textwidth{43\baselineskip}
\langle 10pt \& bk \rangle \setlength\textwidth{41\baselineskip}
\langle 11pt \rangle \setlength\textwidth{38\baselineskip}
\langle 12pt \rangle \setlength\textwidth{36\baselineskip}
\else
\end{verbatim}

\textwidth
Again we compute this, depending on the papersize and depending on the
baselineskip that is used, in order to have a whole number of lines on the page.

\begin{verbatim}
\else
\setlength\@tempdima\paperheight
\addtolength\@tempdima{-2in}
\addtolength\@tempdima{-1.5in}
\divide\@tempdima\baselineskip
\@tempcnta=\@tempdima\n\setlength\textwidth{\@tempcnta\baselineskip}
\fi
\end{verbatim}

The first line on the page has a height of \topskip.
6.3.3 Margins

Most of the values of these parameters are now calculated, based on the papersize in use. In the calculations the \marginparsep needs to be taken into account so we give it its value first.

The horizontal space between the main text and marginal notes is determined by \marginparsep, the minimum vertical separation between two marginal notes is controlled by \marginparpush.

Now we can give the values for the other margin parameters. For native \LaTeX{} 2ε, these are calculated.

First we give the values for the compatibility mode.

Values for two-sided printing:

Values for one-sided printing:
When we are not in compatibility mode we can take the dimensions of the selected paper into account.

The values for \textwidth and \marginparsep will be set depending on the status of the \if@twoside.

If \@twoside is true (which is always the case for book) we make the inner margin smaller than the outer one.

The width of the margin for text is set to the remainder of the width except for a ‘real margin’ of white space of width 0.4in. A check should perhaps be built in to ensure that the (text) margin width does not get too small!

For one-sided printing we center the text on the page, by calculating the difference between \textwidth and \paperwidth. Half of that difference is than used for the margin (thus \oddsidemargin is 1in less).

With the above algorithm the \marginparwidth can come out quite large which we may not want.
Having done these calculations we make them pt values.

The \texttt{\evensidemargin} can now be computed from the values set above.

Setting \texttt{\evensidemargin} to a full point value may produce a small error. However it will lie within the error range a doublesided printer of today's technology can accurately print.

\texttt{\topmargin} is the distance between the top of the printable area—which is 1 inch below the top of the paper—and the top of the box which contains the running head.

It can now be computed from the values set above.

By changing the factor in the next line the complete page can be shifted vertically.

6.3.4 Footnotes

\texttt{\footnotesep} is the height of the strut placed at the beginning of every footnote. It equals the height of a normal \texttt{\footnotesize} strut in this class, thus no extra space occurs between footnotes.

\texttt{\skip\footins} is the space between the last line of the main text and the top of the first footnote.
6.3.5 Float placement parameters

All float parameters are given default values in the \LaTeX\ ε kernel. For this reason parameters that are not counters need to be set with \texttt{\textbackslash renewcommand}.

Limits for the placement of floating objects

\c@topnumber The \texttt{topnumber} counter holds the maximum number of floats that can appear on the top of a text page.
\begin{verbatim}
402 \renewcommand\setcounter{topnumber}{2}
\end{verbatim}

\topfraction This indicates the maximum part of a text page that can be occupied by floats at the top.
\begin{verbatim}
404 \renewcommand\topfraction{.7}
\end{verbatim}

\c@bottomnumber The \texttt{bottomnumber} counter holds the maximum number of floats that can appear on the bottom of a text page.
\begin{verbatim}
405 \setcounter{bottomnumber}{1}
\end{verbatim}

\bottomfraction This indicates the maximum part of a text page that can be occupied by floats at the bottom.
\begin{verbatim}
406 \renewcommand\bottomfraction{.3}
\end{verbatim}

\c@totalnumber This indicates the maximum number of floats that can appear on any text page.
\begin{verbatim}
407 \setcounter{totalnumber}{3}
\end{verbatim}

\textfraction This indicates the minimum part of a text page that has to be occupied by text.
\begin{verbatim}
408 \renewcommand\textfraction{.2}
\end{verbatim}

\floatpagefraction This indicates the minimum part of a page that has to be occupied by floating objects before a ‘float page’ is produced.
\begin{verbatim}
409 \renewcommand\floatpagefraction{.5}
\end{verbatim}

\c@dbltopnumber The \texttt{dbltopnumber} counter holds the maximum number of two column floats that can appear on the top of a two column text page.
\begin{verbatim}
410 \setcounter{dbltopnumber}{2}
\end{verbatim}

\dbltopfraction This indicates the maximum part of a two column text page that can be occupied by two column floats at the top.
\begin{verbatim}
411 \renewcommand\dbltopfraction{.7}
\end{verbatim}

\dblfloatpagefraction This indicates the minimum part of a page that has to be occupied by two column wide floating objects before a ‘float page’ is produced.
\begin{verbatim}
412 \renewcommand\dblfloatpagefraction{.5}
\end{verbatim}
Floats on a text page

\floatsep When a floating object is placed on a page with text, these parameters control the separation between the float and the other objects on the page. These parameters are used for both one-column mode and single-column floats in two-column mode.

\textfloatsep is the space between adjacent floats that are moved to the top or bottom of the text page.

\intextsep is the space between the main text and floats at the top or bottom of the page.

\floatsep is the space between adjacent floats that are moved to the top or bottom of the text page.

\textfloatsep is the space between the main text and floats at the top or bottom of the page.

\intextsep is the space between in-text floats and the text.

\setlength{\floatsep}{12\p@ \@plus 2\p@ \@minus 2\p@}
\setlength{\textfloatsep}{20\p@ \@plus 2\p@ \@minus 4\p@}
\setlength{\intextsep}{12\p@ \@plus 2\p@ \@minus 2\p@}

\dblfloatsep When floating objects that span the whole \textwidth are placed on a text page when we are in two-column mode the separation between the float and the text is controlled by \dblfloatsep and \dbltextfloatsep.

\dblfloatsep is the space between adjacent floats that are moved to the top or bottom of the text page.

\dbltextfloatsep is the space between the main text and floats at the top or bottom of the page.

\setlength{\dblfloatsep}{12\p@ \@plus 2\p@ \@minus 2\p@}
\setlength{\dbltextfloatsep}{20\p@ \@plus 2\p@ \@minus 4\p@}
\setlength{\intextsep}{14\p@ \@plus 4\p@ \@minus 4\p@}

\floats on their own page or column

\@fptop When floating objects are placed on separate pages the layout of such pages is controlled by these parameters. At the top of the page \@fptop amount of stretchable whitespace is inserted, at the bottom of the page we get an \@fpbot amount of stretchable whitespace. Between adjacent floats the \@fpsep is inserted.
These parameters are used for the placement of floating objects in one column mode, or in single column floats in two column mode.

Note that at least one of the two parameters \@fptop and \@fpbot should contain a plus ...fil to allow filling the remaining empty space.

\setlength\@fptop{0\p@ \plus 1fil}
\setlength\@fpsep{8\p@ \plus 2fil}
\setlength\@fpbot{0\p@ \plus 1fil}

Double column floats in two column mode are handled with similar parameters.

\setlength\@dblfptop{0\p@ \plus 1fil}
\setlength\@dblfpsep{8\p@ \plus 2fil}
\setlength\@dblfpbot{0\p@ \plus 1fil}

\ps@foo

The page style foo is defined by defining the command \ps@foo. This command should make only local definitions. There should be no stray spaces in the definition, since they could lead to mysterious extra spaces in the output (well, that’s something that should be always avoided).

The \ps@... command defines the macros @oddhead, @oddfoot, @evenhead, and @evenfoot to define the running heads and feet—e.g., @oddhead is the macro to produce the contents of the heading box for odd-numbered pages. It is called inside an \hbox of width \textwidth.
6.4.1 Marking conventions

To make headings determined by the sectioning commands, the page style defines the commands `\chaptermark`, `\sectionmark`, . . . , where `\chaptermark{TEXT}` is called by `\chapter` to set a mark, and so on.

The `\...mark` commands and the `\...head` macros are defined with the help of the following macros. (All the `\...mark` commands should be initialized to no-ops.)

If \TeX\ extends \TeX\'s `\mark` facility by producing two kinds of marks, a ‘left’ and a ‘right’ mark, using the following commands:

`\markboth{⟨LEFT⟩}{⟨RIGHT⟩}`: Adds both marks.
`\markright{⟨RIGHT⟩}`: Adds a ‘right’ mark.
`\leftmark`: Used in the `\@oddhead`, `\@oddfoot`, `\@evenhead` or `\@evenfoot` macros, it gets the current ‘left’ mark. `\leftmark` works like \TeX\'s `\botmark` command.
`\rightmark`: Used in the `\@oddhead`, `\@oddfoot`, `\@evenhead` or `\@evenfoot` macros, it gets the current ‘right’ mark. `\rightmark` works like \TeX\'s `\firstmark` command.

The marking commands work reasonably well for right marks ‘numbered within’ left marks—e.g., the left mark is changed by a `\chapter` command and the right mark is changed by a `\section` command. However, it does produce somewhat anomalous results if two `\markboth`‘s occur on the same page.

Commands like `\tableofcontents` that should set the marks in some page styles use a `\@mkboth` command, which is `\let` by the pagestyle command (`\ps@...`) to `\markboth` for setting the heading or to `\@gobbletwo` to do nothing.

6.4.2 Defining the page styles

The pagestyles empty and plain are defined in latex.dtx.

\ps@headings

The definition of the page style headings has to be different for two sided printing than it is for one sided printing.

\input{t1_472-478}

\let\@oddhead\@empty\let\@evenhead\@empty
\def\@evenhead{\thepage\hfil\slshape\leftmark}\%
\def\@oddhead{{\slshape\rightmark}\hfil\thepage}\%

When using this page style, the contents of the running head is determined by the chapter and section titles. So we `\let \@mkboth` to `\markboth`.

\let\@mkboth\markboth

For the article document class we define `\sectionmark` to clear the right mark and put the number of the section (when it is numbered) and its title in the left mark. The rightmark is set by `\subsectionmark` to contain the subsection titles.

Note the use of `##1` for the parameter of the `\sectionmark` command, which will be defined when `\ps@headings` is executed.

(*article)
In the report and book document classes we use the \chaptermark and \sectionmark macros to fill the running heads.

Note the use of ##1 for the parameter of the \chaptermark command, which will be defined when \ps@headings is executed.

The definition of \ps@headings for one sided printing can be much simpler, because we treat even and odd pages the same. Therefore we don’t need to define \@even... \else \def\ps@headings{%
\let\@oddfoot\@empty\def\@oddhead{{\slshape\rightmark}\hfil\thepage}\let\@mkboth\markboth

We use \markright now instead of \markboth as we did for two sided printing.
The definition of the page style \texttt{myheadings} is fairly simple because the user determines the contents of the running head himself by using the \texttt{markboth} and \texttt{markright} commands.

\begin{quote}
\verb|\ps@myheadings| \par
\end{quote}

\begin{quote}
\verb|\let\@oddfoot\@empty\let\@evenfoot\@empty| \par
\verb|\def\@evenhead{| \par
\verb|\hfil\slshape\leftmark| \par
\verb|\def\@oddhead{| \par
\verb|\slshape\rightmark\hfil\thepage| \par
\end{quote}

We have to make sure that the marking commands that are used by the chapter and section headings are disabled. We do this by setting them to a macro that gobbles its argument(s).

\begin{quote}
\verb|\let\@mkboth\@gobbletwo| \par
\verb|\let\chaptermark\@gobble| \par
\verb|\let\sectionmark\@gobble| \par
\verb|\let\subsectionmark\@gobble| \par
\verb|\let\@oddfoot\@empty| \par
\verb|\let\@evenfoot\@empty| \par
\verb|\def\@evenhead{| \par
\verb|\hfil\slshape\leftmark| \par
\verb|\def\@oddhead{| \par
\verb|\slshape\rightmark\hfil\thepage| \par
\end{quote}

7 Document Markup

7.1 The title

\begin{quote}
\verb|\title| \par
\verb|\author| \par
\verb|\date| \par
\end{quote}

These three macros are provided by \texttt{latex.dtx} to provide information about the title, author(s) and date of the document. The information is stored away in internal control sequences. It is the task of the \texttt{maketitle} command to use the information provided. The definitions of these macros are shown here for information.

\begin{quote}
\verb|% \DeclareRobustCommand*{\title}{\gdef@title{#1}}| \par
\verb|% \DeclareRobustCommand*{\author}{\gdef@author{#1}}| \par
\verb|% \DeclareRobustCommand*{\date}{\gdef@date{#1}}| \par
\end{quote}

The \texttt{\date} macro gets today’s date by default.

\begin{quote}
\verb|% \date{\today}| \par
\end{quote}

\begin{quote}
\verb|\maketitle| \par
\end{quote}

The definition of \texttt{\maketitle} depends on whether a separate title page is made. This is the default for the report and book document classes, but for the article class it is optional.

When we are making a title page, we locally redefine \texttt{footnotesize} and \texttt{footnoterule} to change the appearance of the footnotes that are produced by the \texttt{thanks} command; these changes affect all footnotes.

\begin{quote}
\verb|\if@titlepage| \par
\verb|\newcommand\maketitle{\begin{titlepage}| \par
\end{quote}
We center the entire title vertically; the centering is set off a little by adding a \vskip. (In compatibility mode the page number is set to 0 by the titlepage environment to keep the behaviour of \LaTeX\ 2.09 style files.)

Then we set the title, in a \texttt{\LARGE} font; leave a little space and set the author(s) in a \texttt{\large} font. We do this inside a tabular environment to get them in a single column. Before the date we leave a little whitespace again.

Then we call \texttt{\@thanks} to print the information that goes into the footnote and finish the page.

We reset the footnote counter, disable \texttt{\thanks} and \texttt{\maketitle} and save some storage space by emptying the internal information macros.

After the title is set the declaration commands \texttt{\title}, etc. can vanish. The definition of \texttt{\and} makes only sense within the argument of \texttt{\author} so this can go as well.

When the title is not on a page of its own, the layout of the title is a little different. We use symbols to mark the footnotes and we have to deal with two column documents.

Therefore we first start a new group to keep changes local. Then we redefine \texttt{\thefootnote} to use \texttt{\fnsymbol}; and change \texttt{\@makefnmark} so that footnotemarks have zero width (to make the centering of the author names look better).
If this is a twocolumn document we start a new page in twocolumn mode, with the title set to the full width of the text. The actual printing of the title information is left to \maketitle.

When this is not a twocolumn document we just start a new page, prevent floating objects from appearing on the top of this page and print the title information.

This page gets a plain layout. We call \thanks to produce the footnotes.

Now we can close the group, reset the \footnote counter, disable \thanks, \maketitle and \@maketitle and save some storage space by emptying the internal information macros.

\maketitle This macro takes care of formatting the title information when we have no separate title page.

We always start a new page, leave some white space and center the information. The title is set in a \LARGE font, the author names and the date in a \large font.
7.2 Chapters and Sections

7.2.1 Building blocks

The definitions in this part of the class file make use of two internal macros, \@startsection and \seccdef. To understand what is going on here, we describe their syntax.

The macro \@startsection has 6 required arguments, optionally followed by a *, an optional argument and a required argument:

\@startsection⟨name⟩⟨level⟩⟨indent⟩⟨beforeskip⟩⟨afterskip⟩⟨style⟩ optional *

[⟨altheading⟩]⟨heading⟩

It is a generic command to start a section, the arguments have the following meaning:

⟨name⟩ The name of the user level command, e.g., ‘section’.

⟨level⟩ A number, denoting the depth of the section – e.g., chapter=1, section = 2, etc. A section number will be printed if and only if ⟨level⟩ <= the value of the seccnumdepth counter.

⟨indent⟩ The indentation of the heading from the left margin

⟨beforeskip⟩ The absolute value of this argument gives the skip to leave above the heading. If it is negative, then the paragraph indent of the text following the heading is suppressed.

⟨afterskip⟩ If positive, this gives the skip to leave below the heading, else it gives the skip to leave to the right of a run-in heading.

⟨style⟩ Commands to set the style of the heading.

* When this is missing the heading is numbered and the corresponding counter is incremented.

⟨altheading⟩ Gives an alternative heading to use in the table of contents and in the running heads. This should not be present when the * form is used.

⟨heading⟩ The heading of the new section.
A sectioning command is normally defined to \texttt{\@startsection} and its first six arguments.

The macro \texttt{\secdef} can be used when a sectioning command is defined without using \texttt{\@startsection}. It has two arguments:

\texttt{\secdef(unstarcmds)(starcmds)}

\texttt{\langle unstarcmds \rangle} Used for the normal form of the sectioning command.

\texttt{\langle starcmds \rangle} Used for the \* form of the sectioning command.

You can use \texttt{\secdef} as follows:

\begin{verbatim}
def\chapter { ... \secdef \CMDA \CMDB }
def\CMDA [#1]#2{ ... } % Command to define % \chapter{[...]{...}
def\CMDB #1{ ... } % Command to define % \chapter*{...}
\end{verbatim}

7.2.2 Mark commands

\texttt{\chaptermark} \texttt{\sectionmark} \texttt{\subsectionmark} \texttt{\subsubsectionmark} \texttt{\paragraphmark} \texttt{\subparagraphmark} Default initializations of \ldots mark commands. These commands are used in the definition of the page styles (see section 6.4.2) Most of them are already defined by \texttt{latex.dtx}, so they are only shown here.

\begin{verbatim}
631 \langle article\rangle \newcommand*{\chaptermark}[1]{}
632 \% \newcommand*{\sectionmark}[1]{}
633 \% \newcommand*{\subsectionmark}[1]{}
634 \% \newcommand*{\subsubsectionmark}[1]{}
635 \% \newcommand*{\paragraphmark}[1]{}
636 \% \newcommand*{\subparagraphmark}[1]{}
\end{verbatim}

7.2.3 Define Counters

\texttt{\c@secnumdepth} The value of the counter \texttt{secnumdepth} gives the depth of the highest-level sectioning command that is to produce section numbers.

\begin{verbatim}
637 \langle article\rangle \setcounter{secnumdepth}{3}
638 \langle article\rangle \setcounter{secnumdepth}{2}
\end{verbatim}

\texttt{\c@part} \texttt{\c@chapter} \texttt{\c@section} \texttt{\c@subsection} \texttt{\c@paragraph} \texttt{\c@subparagraph} These counters are used for the section numbers. The macro \texttt{\newcounter{(newctr)}{(oldctr)}} defines\texttt{(newctr)} to be a counter, which is reset to zero when counter \texttt{\langle oldctr \rangle} is stepped. Counter \texttt{\langle oldctr \rangle} must already be defined.

\begin{verbatim}
639 \newcounter {part}
640 \newcounter {chapter}
641 \newcounter {section}
642 \newcounter {subsection}
643 \newcounter {paragraph}
644 \newcounter {subparagraph}
\end{verbatim}
For any counter \texttt{CTR}, \texttt{\theCTR} is a macro that defines the printed version of counter \texttt{CTR}. It is defined in terms of the following macros:

\begin{itemize}
  \item[$\bullet$] \texttt{\arabic{COUNTER}} prints the value of \texttt{COUNTER} as an arabic numeral.
  \item[$\bullet$] \texttt{\roman{COUNTER}} prints the value of \texttt{COUNTER} as a lowercase roman numeral.
  \item[$\bullet$] \texttt{\Roman{COUNTER}} prints the value of \texttt{COUNTER} as an uppercase roman numeral.
  \item[$\bullet$] \texttt{\alph{COUNTER}} prints the value of \texttt{COUNTER} as a lowercase letter: \[1 = a, 2 = b, \text{etc.}\]
  \item[$\bullet$] \texttt{\Alph{COUNTER}} prints the value of \texttt{COUNTER} as an uppercase letter: \[1 = A, 2 = B, \text{etc.}\]
\end{itemize}

Actually to save space the internal counter representations and the commands operating on those are used.

\begin{verbatim}
\renewcommand{\thepart}{\@Roman\c@part}
\renewcommand{\thesection}{\@arabic\c@section}
\renewcommand{\thechapter}{\@arabic\c@chapter}
\renewcommand{\thesection}{\thechapter.\@arabic\c@section}
\renewcommand{\thesubsection}{\thesection.\@arabic\c@subsection}
\renewcommand{\thesubsubsection}{\thesubsection.\@arabic\c@subsubsection}
\renewcommand{\theparagraph}{\thesubsubsection.\@arabic\c@paragraph}
\renewcommand{\thesubparagraph}{\theparagraph.\@arabic\c@subparagraph}
\end{verbatim}

\@chapapp
\@chapapp is initially defined to be \texttt{\chaptername}. The \texttt{\appendix} command redefines it to be \texttt{\appendixname}.

\begin{verbatim}
\newcommand{\frontmatter}{%\if@openright\cleardoublepage\else\clearpage\fi\@mainmatterfalse\pagenumbering{roman}}
\newcommand{\mainmatter}{%\if@openright\cleardoublepage\else\clearpage\fi\@mainmattertrue\pagenumbering{arabic}}
\end{verbatim}

7.2.4 Front Matter, Main Matter, and Back Matter

A book contains these three (logical) sections. The switch \texttt{@mainmatter} is true iff we are processing Main Matter. When this switch is false, the \texttt{\chapter} command does not print chapter numbers.

Here we define the commands that start these sections.

\texttt{\frontmatter} This command starts Roman page numbering and turns off chapter numbering. Since this restarts the page numbering from 1, it should also ensure that a recto page is used.

\begin{verbatim}
\newcommand{\frontmatter}{%\if@openright\cleardoublepage\else\clearpage\fi\@mainmatterfalse\pagenumbering{roman}}
\end{verbatim}

\texttt{\mainmatter} This command clears the page, starts arabic page numbering and turns on chapter numbering. Since this restarts the page numbering from 1, it should also ensure that a recto page is used.

\begin{verbatim}
\newcommand{\mainmatter}{%\if@openright\cleardoublepage\else\clearpage\fi\@mainmattertrue\pagenumbering{arabic}}
\end{verbatim}
This clears the page, turns off chapter numbering and leaves page numbering unchanged.

For the report and book classes we things a bit different. We start a new (righthand) page and use the plain pagestyle.

When we are making a two column document, this will be a one column page. We use \@tempswa to remember to switch back to two columns.
We need an empty box to prevent the fill glue from disappearing.

Here we use \texttt{\textbackslash secdef} to indicate which commands to use to make the actual heading.

\texttt{\textbackslash secdef\textbackslash @part}\texttt{\textbackslash @spart}

\texttt{\textbackslash @part} This macro does the actual formatting of the title of the part. Again the macro is differently defined for the article document class than for the document classes report and book.

When \texttt{secnumdepth} is larger than \texttt{−1} for the document class article, we have a numbered part, otherwise it is unnumbered.

\texttt{\textbackslash @part} This macro should prevent a page break here.

\texttt{\textbackslash @afterheading} take care of suppressing the indentation.

When \texttt{secnumdepth} is larger than \texttt{−2} for the document class report and book, we have a numbered part, otherwise it is unnumbered.
We empty the mark registers and center the title on the page in the report and book document classes. Also we prevent breaking between lines and reset the font.

\markboth{}
\centering
\interlinepenalty \@M
\normalfont

When this is a numbered part we have to print the number.
\ifnum \c@secnumdepth >-2\relax
\huge \bfseries \partname \nobreakspace \thepart
\par
\fi
\Huge \bfseries #2\par}
\@endpart

\@spart This macro does the actual formatting of the title of the part when the star form of the user command was used. In this case we never print a number. Otherwise the formatting is the same.

The differences between the definition of this macro in the article document class and in the report and book document classes are similar as they were for \@part.

\@endpart This macro finishes the part page, for both \@part and \@spart.

First we fill the current page.
\if@twoside
\if@openright
\vfil
\newpage
Then, when we are in twosided mode and chapters are supposed to be on right hand sides, we produce a completely blank page.
\if@twoside
\if@twoside
\if@openright

30
When this was a two column document we have to switch back to two column mode.

\if@tempswa
\twocolumn
\fi}

⟨report⟩

7.2.6 Chapters

\chapter A chapter should always start on a new page therefore we start by calling \clearpage and setting the pagestyle for this page to plain.
\newcommand\chapter{\if@openright\cleardoublepage\else\clearpage\fi
\thispagestyle{plain}%
Then we prevent floats from appearing at the top of this page because it looks weird to see a floating object above a chapter title.
\global\@topnum\z@
Then we suppress the indentation of the first paragraph by setting the switch \@afterindent to false. We use \secdef to specify the macros to use for actually setting the chapter title.
\@afterindentfalse
\secdef\@chapter\@schapter}
\@chapter
This macro is called when we have a numbered chapter. When \secnumdepth is larger than \hsize and, in the book class, \@mainmatter is true, we display the chapter number. We also inform the user that a new chapter is about to be typeset by writing a message to the terminal.
\def\@chapter[#1]#2{\ifnum \c@secnumdepth >\@ne
\if@mainmatter
\refstepcounter{chapter}%
\typeout{\@chapapp\space thechapter.}%
\addcontentsline{toc}{chapter}{%
\protect\numberline{\thechapter}#1}%
\else
\addcontentsline{toc}{chapter}{#1}%
\fi
\fi
\else
\addcontentsline{toc}{chapter}{#1}%
\fi
After having written an entry to the table of contents we store the (alternative) title of this chapter with \chaptermark and add some white space to the lists of figures and tables.
\chaptermark{#1}
Then we call upon `\@makechapterhead` to format the actual chapter title. We have to do this in a special way when we are in twocolumn mode in order to have the chapter title use the entire `\textwidth`. In one column mode we call `\@afterheading` which takes care of suppressing the indentation.

```latex
\if@twocolumn
\@topnewpage\[
\@makechapterhead{#2}\]
\else
\@makechapterhead{#2}\% 
\@afterheading
\fi
```

`\@makechapterhead` macro uses `\@makechapterhead` to format the heading of the chapter. We begin by leaving some white space. Then we open a group in which we have a paragraph indent of 0pt, and in which we have the text set ragged right. We also reset the font.

```latex
\def\@makechapterhead#1{\% 
\vspace*{50\p@}\% 
\parindent \z@ \raggedright \normalfont
```

Then we check whether the number of the chapter has to be printed. If so we leave some whitespace between the chapter number and its title.

```latex
\ifnum \c@secnumdepth >\m@ne \% 
\vspace*{50\p@}\% 
{\parindent \z@ \raggedright \normalfont
\fi
```

Now we set the title in a large bold font. We prevent a pagebreak from occurring in the middle of or after the title. Finally we leave some whitespace before the text begins.

```latex
\interlinepenalty\@M
\Huge \bfseries #1\par\nobreak
\vskip 40\p@\% 
```

`\@schapter` macro is called when we have an unnumbered chapter. It is much simpler than `\@chapter` because it only needs to typeset the chapter title.

```latex
\ifnum \c@secnumdepth >\m@ne \% 
(\text{book}) \% 
\if@mainmatter \% 
\huge \bfseries \@chapapp\space \thechapter \% 
\par\nobreak \% 
\vskip 20\p@ \% 
\fi \% 
fi \% 
```

Now we set the title in a large bold font. We prevent a pagebreak from occurring in the middle of or after the title. Finally we leave some whitespace before the text begins.

```latex
\interlinepenalty\@M
\Huge \bfseries #1\par\nobreak
\vskip 40\p@ 
```

`\@makeschapterhead` macro is called when we have an unnumbered chapter. It is much simpler than `\@chapter` because it only needs to typeset the chapter title.

```latex
\def\@schapter#1{\% 
(\text{book}) \% 
\if@twocolumn \% 
\@topnewpage\[
\@makeschapterhead{#1}\]\% 
\else \% 
\@makeschapterhead{#1}\% 
\@afterheading
\fi
```

The macro above uses `\@makeschapterhead` to format the heading of the chapter. It is similar to `\@makechapterhead` except that it never has to print a chapter number.
7.2.7 Lower level headings

These commands all make use of \@startsection.

\section This gives a normal heading with white space above and below the heading, the title set in \Large\bfseries, and no indentation on the first paragraph.

\subsection This gives a normal heading with white space above and below the heading, the title set in \large\bfseries, and no indentation on the first paragraph.

\subsubsection This gives a normal heading with white space above and below the heading, the title set in \normalsize\bfseries, and no indentation on the first paragraph.

\paragraph This gives a run-in heading with white space above and to the right of the heading, the title set in \normalsize\bfseries.

\subparagraph This gives an indented run-in heading with white space above and to the right of the heading, the title set in \normalsize\bfseries.
7.3 Lists

7.3.1 General List Parameters

The following commands are used to set the default values for the list environment’s parameters. See the \LaTeX manual for an explanation of the meanings of the parameters. Defaults for the list environment are set as follows. First, \rightmargin, \listparindent and \itemindent are set to 0pt. Then, for a Kth level list, the command \@listK is called, where ‘K’ denotes ‘i’, ‘ii’, ... , ‘vi’. (I.e., \@listiii is called for a third-level list.) By convention, \@listK should set \leftmargin to \leftmarginK.

\leftmargini When we are in two column mode some of the margins are set somewhat smaller.
\leftmarginii \leftmargini \leftmarginiii \leftmarginiv \leftmarginv \leftmarginvi
When the user leaves a blank line before the environment an extra vertical space of \partopsep is inserted, in addition to \parskip and \topsep.
\partopsep These penalties are inserted before and after a list or paragraph environment.
\beginparpenalty \Endparpenalty These penalties are inserted before and after a list or paragraph environment.
\@itempenalty This penalty is inserted between list items.
\@listi \@listi defines the values of \leftmargin, \parsep, \topsep, \itemsep, etc. for the lists that appear on top-level. Its definition is modified by the font-size commands (eg within \small the list parameters get “smaller” values).

For this reason listI is defined to hold a saved copy of listi so that \normalsize can switch all parameters back.

\@listii \@listii \@listiii \@listiv \@listv \@listvi Here are the same macros for the higher level lists. Note that they don’t have saved versions and are not modified by the font size commands. In other words this class assumes that nested lists only appear in \normalsize, i.e. the main document size.

\@listvii \@listviii \@listix \@listx \@listxi

We initialise the parameters although strictly speaking that is not necessary.
7.3.2 Enumerate

The enumerate environment uses four counters: \texttt{enumi}, \texttt{enumii}, \texttt{enumiii} and \texttt{enumiv}, where \texttt{enumN} controls the numbering of the \texttt{Nth} level enumeration.

\newcommand\labelenumi{\theenumi.}
\newcommand\labelenumii{\textup{\textbullet}}
\newcommand\labelenumiii{\textup{\textbullet}}
\newcommand\labelenumiv{\textup{\textbullet}}

7.3.3 Itemize

Itemization is controlled by four commands: \texttt{\labelitemi}, \texttt{\labelitemii}, \texttt{\labelitemiii}, and \texttt{\labelitemiv}, which define the labels of the various itemization levels: the symbols used are bullet, bold en-dash, centered asterisk and centred dot.

\newcommand\labelitemi{\textbullet}
7.3.4 Description

The description environment is defined here – while the itemize and enumerate environments are defined in latex.dtx.

\begin{description}
\item[\descriptionlabel]{To change the formatting of the label, you must redefine \descriptionlabel.}
\end{description}

7.4 Defining new environments

7.4.1 Abstract

When we are producing a separate titlepage we also put the abstract on a page of its own. It will be centred vertically on the page.

Note that this environment is not defined for books.

\begin{abstract}
\end{abstract}

When we are not making a separate titlepage –the default for the article document class– we have to check if we are in twocolumn mode. In that case the abstract is as a \section*, otherwise the quotation environment is used to typeset the abstract.

\begin{abstract}
\end{abstract}
7.4.2 Verse

verse The verse environment is defined by making clever use of the list environment’s parameters. The user types `\` to end a line. This is implemented by `\let`ing `\` equal `\@centercr`.

\newenvironment{verse}
{
  \let\\@centercr
  \list{}{\itemsep \z@ \\
    \itemindent -1.5em
    \listparindent\itemindent
    \rightmargin \leftmargin
    \advance\leftmargin 1.5em}
  \item\relax}
{
  \endlist}

7.4.3 Quotation

quotation The quotation environment is also defined by making clever use of the list environment’s parameters. The lines in the environment are set smaller than `\textwidth`. The first line of a paragraph inside this environment is indented.

\newenvironment{quotation}
{
  \list{}{\listparindent 1.5em
    \itemindent \listparindent
    \rightmargin \leftmargin
    \parsep \z@ \@plus\p@}
  \item\relax}
{
  \endlist}

7.4.4 Quote

quote The quote environment is like the quotation environment except that paragraphs are not indented.

\newenvironment{quote}
{
  \list{}{\rightmargin\leftmargin}
  \item\relax}
{
  \endlist}

7.4.5 Theorem

This document class does not define it’s own theorem environments, the defaults, supplied by `latex.dtx` are available.

7.4.6 Titlepage

titlepage In the normal environments, the titlepage environment does nothing but start and end a page, and inhibit page numbers. In the report style, it also resets the page number to one, and then sets it back to one at the end. In compatibility mode, it sets the page number to zero. This is incorrect since it results in using the page number
parameters for a right-hand page but it is the way it was. In two-column style, it
still makes a one-column page.

First we do give the definition for compatibility mode.

\if@compatibility
\newenvironment{titlepage}
{\
\langle book\rangle\cleardoublepage
\if@twocolumn
\@restonecoltrue\onecolumn
\else
\@restonecolfalse\newpage
\fi
\thispagestyle{empty}\
\setcounter{page}\z@
}{\if@restonecol\twocolumn \else \newpage \fi
\fi}
\else
\newenvironment{titlepage}
{\
\langle book\rangle\cleardoublepage
\if@twocolumn
\@restonecoltrue\onecolumn
\else
\@restonecolfalse\newpage
\fi
\thispagestyle{empty}\
\setcounter{page}\@ne
}{\if@restonecol\twocolumn \else \newpage \fi
\fi}
\fi

And here is the one for native \LaTeXe.
\if@twoside
\newenvironment{titlepage}
{\langle*article\rangle\cleardoublepage
\if@twocolumn
\@restonecoltrue\onecolumn
\else
\@restonecolfalse\newpage
\fi
\thispagestyle{empty}\
\setcounter{page}\@ne
}{\if@restonecol\twocolumn \else \newpage \fi
\fi
\else
\newenvironment{titlepage}
{\langle book\rangle\cleardoublepage
\if@twocolumn
\@restonecoltrue\onecolumn
\else
\@restonecolfalse\newpage
\fi
\thispagestyle{empty}\
\setcounter{page}\@ne
}{\if@restonecol\twocolumn \else \newpage \fi
\fi
\fi

If we are not in two-side mode the first page after the title page should also get
page number 1.
\if@twoside\else
\setcounter{page}\@ne
\fi
\fi

7.4.7 Appendix

\appendix

The \appendix command is not really an environment, it is a macro that makes
some changes in the way things are done.

In the article document class the \appendix command must do the following:

- reset the section and subsection counters to zero,
- redefine \thesection to produce alphabetic appendix numbers. This redef-
  inition is done globally to ensure that it survives even if \appendix is issued
  within an environment such as \multicols.
In the report and book document classes the `\appendix` command must do the following:

- reset the chapter and section counters to zero,
- set `\@chapapp` to `appendixname` (for messages),
- redefine the chapter counter to produce appendix numbers,
- possibly redefine the `\chapter` command if appendix titles and headings are to look different from chapter titles and headings. This redefinition is done globally to ensure that it survives even if `\appendix` is issued within an environment such as `multicols`.

7.5 Setting parameters for existing environments

7.5.1 Array and tabular

`\arraycolsep` The columns in an array environment are separated by 2 `\arraycolsep`.

`\tabcolsep` The columns in a tabular environment are separated by 2 `\tabcolsep`.

`\arrayrulewidth` The width of rules in the array and tabular environments is given by `\arrayrulewidth`.

`\doublerulesep` The space between adjacent rules in the array and tabular environments is given by `\doublerulesep`.

7.5.2 Tabbing

`\tabbingsep` This controls the space that the `\ ` command puts in. (See LATEX manual for an explanation.)
7.5.3 Minipage

\@minipagerestore The macro \@minipagerestore is called upon entry to a minipage environment to set up things that are to be handled differently inside a minipage environment. In the current styles, it does nothing.

\@mpfootins Minipages have their own footnotes; \skip\@mpfootins plays same rôle for footnotes in a minipage as \skip\footins does for ordinary footnotes.

7.5.4 Framed boxes

\fboxsep The space left by \fbox and \framebox between the box and the text in it.

\fboxrule The width of the rules in the box made by \fbox and \framebox.

7.5.5 Equation and eqnarray

\theequation When within chapters, the equation counter will be reset at the beginning of a new chapter and the equation number will be prefixed by the chapter number.

This code must follow the \chapter definition or, more exactly, the definition of the chapter counter.

% \setlength\jot{3pt}

\@eqnnum The macro \@eqnnum defines how equation numbers are to appear in equations. Again the default is used.

7.6 Floating objects

The file latex.dtx only defines a number of tools with which floating objects can be defined. This is done in the document class. It needs to define the following macros for each floating object of type TYPE (e.g., TYPE = figure).

\fps\@TYPE The default placement specifier for floats of type TYPE.

\ftype\@TYPE The type number for floats of type TYPE. Each TYPE has associated a unique positive TYPE number, which is a power of two. E.g., figures might have type number 1, tables type number 2, programs type number 4, etc.

\ext\@TYPE The file extension indicating the file on which the contents list for float type TYPE is stored. For example, \ext\@figure = ‘lof’.
\texttt{\fnum@TYPE} A macro to generate the figure number for a caption. For example, \texttt{\fnum@TYPE == ’Figure \thefigure’}.

\texttt{@makecaption}⟨\num⟩⟨\text⟩ A macro to make a caption, with ⟨\num⟩ the value produced by \fnum@... and ⟨\text⟩ the text of the caption. It can assume it’s in a \parbox of the appropriate width. This will be used for all floating objects.

The actual environment that implements a floating object such as a figure is defined using the macros \@float and \end@float, which are defined in \texttt{latex.dtx}.

An environment that implements a single column floating object is started with \@float⟨\TYPE⟩⟨⟨\placement⟩⟩ of type \TYPE with ⟨\placement⟩ as the placement specifier. The default value of ⟨\PLACEMENT⟩ is defined by \fps@TYPE.

The environment is ended by \end@float. E.g., \texttt{\figure == \@floatfigure, \endfigure == \end@float}.

7.6.1 Figure

Here is the implementation of the figure environment.

\texttt{\c@figure} First we have to allocate a counter to number the figures.

In the report and book document classes figures within chapters are numbered per chapter.

\begin{verbatim}
\newcounter{figure}
\renewcommand \thefigure{\@arabic\c@figure}
\end{verbatim}

\texttt{\fps@figure} Here are the parameters for the floating objects of type ‘figure’.

\begin{verbatim}
\def\fps@figure{tbp}
\def\ftype@figure{1}
\def\ext@figure{lof}
\def\fnum@figure{\figurename\nobreakspace\thefigure}
\end{verbatim}

\texttt{\newenvironment{figure}} And the definition of the actual environment. The form with the * is used for double column figures.

\begin{verbatim}
\newenvironment{figure}
{\@float{figure}}
{\end@float}
\end{verbatim}

7.6.2 Table

Here is the implementation of the table environment. It is very much the same as the figure environment.
First we have to allocate a counter to number the tables.

In the report and book document classes tables within chapters are numbered per chapter.

\newcounter{table}
\renewcommand{\thetable}{\@arabic\c@table}
\newcounter{table}[chapter]
\renewcommand{\thetable}{\ifnum \c@chapter>\z@ \thechapter.\fi \@arabic\c@table}

Here are the parameters for the floating objects of type 'table'.
\def{\fps@table}{tbp}
\def{\ftype@table}{2}
\def{\ext@table}{lot}
\def{\fnum@table}{\tablename{\thetable}}

And the definition of the actual environment. The form with the * is used for double column tables.
\newenvironment{table}{\@float{table}}{\end@float}
\newenvironment{table*}{\@dblfloat{table}}{\end@dblfloat}

7.6.3 Captions
The \caption command calls \@makecaption to format the caption of floating objects. It gets two arguments, \langle number\rangle, the number of the floating object and \langle text\rangle, the text of the caption. Usually \langle number\rangle contains a string such as ‘Figure 3.2’. The macro can assume it is called inside a \parbox of right width, with \normalsize.
\def{\@makecaption}{\long{\vskip{\abovecaptionskip}}}
\sbox{\@tempboxa}{\caption{#1: #2}}
We want to see if the caption fits on one line on the page, therefore we first typeset it in a temporary box.
\@tempboxa{\#1: #2}
We can measure its width. It that is larger than the current \hsize we typeset the caption as an ordinary paragraph.

\begin{verbatim}
1117 \ifdim \wd@tempboxa >\hsize
1118 \#1: \#2\par
1119 \else
1120 \global \@minipagefalse
1121 \hb@xt\hsize{\hfil\box\@tempboxa\hfil}\
1122 \fi
1123 \vskip\belowcaptionskip}
\end{verbatim}

7.7 Font changing

Here we supply the declarative font changing commands that were common in \LaTeX{} version 2.09 and earlier. These commands work in text mode and in math mode. They are provided for compatibility, but one should start using the \text... and \math... commands instead. These commands are defined using \DeclareTextFontCommand, a command with three arguments: the user command to be defined; \LaTeX{} commands to execute in text mode and \LaTeX{} commands to execute in math mode.

\begin{verbatim}
\rm The commands to change the family. When in compatibility mode we select the
\tt ‘default’ font first, to get \LaTeX{}2.09 behaviour.
\sf 1124 \DeclareOldFontCommand{\rm}{\normalfont\rmfamily}{\mathrm}
1125 \DeclareOldFontCommand{\sf}{\normalfont\sffamily}{\mathsf}
1126 \DeclareOldFontCommand{\tt}{\normalfont\ttfamily}{\mathtt}
\bf The command to change to the bold series. One should use \mdseries to explicitly
\it switch back to medium series.
\sl 1127 \DeclareOldFontCommand{\bf}{\normalfont\bfseries}{\mathbf}
1128 \DeclareOldFontCommand{\it}{\normalfont\itshape}{\mathit}
1129 \DeclareOldFontCommand{\sc}{\normalfont\scshape}{\@nomath\sc}
\cal The commands \cal and \mit should only be used in math mode, outside math
\mit mode they have no effect. Currently the New Font Selection Scheme defines these
\cal commands to generate warning messages. Therefore we have to define them ‘by
\end{verbatim}

hand’:

\begin{verbatim}
1131 \DeclareRobustCommand*{\cal}{\@fontswitch\relax\mathcal}
1132 \DeclareRobustCommand*{\mit}{\@fontswitch\relax\mathnormal}
\end{verbatim}
8 Cross Referencing

8.1 Table of Contents, etc.

A \section command writes a \contentsline{section}{{title}}{{page}} command on the .toc file, where \textit{title} contains the contents of the entry and \textit{page} is the page number. If sections are being numbered, then \textit{title} will be of the form \texttt{\numberline{num}{heading}} where \textit{num} is the number produced by \thesec. Other sectioning commands work similarly.

A \caption command in a ‘figure’ environment writes
\contentsline{figure}{{\numberline{num}}{{caption}}}{{page}}
on the .lof file, where \textit{num} is the number produced by \thefigure and \textit{caption} is the figure caption. It works similarly for a ‘table’ environment.

The command \contentsline{(name)} expands to \l@\texttt{name}. So, to specify the table of contents, we must define \l@chapter, \l@section, \l@subsection, \ldots to specify the list of figures, we must define \l@figure; and so on. Most of these can be defined with the \dottedtocline command, which works as follows.
\dottedtocline{level}{indent}{numwidth}{title}{page}

\textbf{level} An entry is produced only if \textit{level} $\leq$ value of the \texttt{tocdepth} counter.

Note, \texttt{chapter} is level 0, \texttt{section} is level 1, etc.

\textbf{indent} The indentation from the outer left margin of the start of the contents line.

\textbf{numwidth} The width of a box in which the section number is to go, if \textit{title} includes a \texttt{numberline} command.

\texttt{\@pnumwidth} The width of a box in which the page number is put.

\texttt{\@tocrmarg} The right margin for multiple line entries. One wants \texttt{\@tocrmarg} $\geq$ \texttt{\@pnumwidth}

\texttt{\@dotsep} Separation between dots, in mu units. Should be defined as a number like 2 or 1.7

\newcommand{\@pnumwidth}{1.55em}
\newcommand{\@tocrmarg}{2.55em}
\newcommand{\@dotsep}{4.5}

8.1.1 Table of Contents

This macro is used to request that \LaTeX{} produces a table of contents. In the report and book document classes the tables of contents, figures etc. are always set in single-column style.

\newcommand{\tableofcontents}{%}
\if@twocolumn

45
The title is set using the `\chapter*` command, making sure that the running head—if one is required—contains the right information.

The code for `\@mkboth` is placed inside the heading to avoid any influence on vertical spacing after the heading (in some cases). For other commands, such as `\listoffigures` below this has been changed from the \LaTeX2.09 version as it will produce a serious bug if used in two-column mode (see, pr/3285). However `\tableofcontents` is always typeset in one-column mode in these classes, therefore the somewhat inconsistent setting has been retained for compatibility reasons.

The actual table of contents is made by calling `\@starttoc{toc}`. After that we restore two-column mode if necessary.

Each sectioning command needs an additional macro to format its entry in the table of contents, as described above. The macro for the entry for parts is defined in a special way.

First we make sure that if a pagebreak should occur, it occurs before this entry. Also a little whitespace is added and a group begun to keep changes local.

We set `\parindent` to 0pt and use `\rightskip` to leave enough room for the pagenumbers.\footnote{We should really set `\rightskip` to `\@tocmarg` instead of `\@pnumwidth` (no version of \LaTeX ever did this), otherwise the `\rightskip` is too small. Unfortunately this can’t be changed in \LaTeX2.09 as we don’t want to create different versions of \LaTeX2.09 which produce different typeset output unless this is absolutely necessary; instead we suspend it for \LaTeX3.} To prevent overfull box messages the `\parfillskip` is set to a negative value.
Now we can set the entry, in a large bold font. We make sure to leave vertical mode, set the part title and add the page number, set flush right.

```
\leavevmode
  \large \bfseries #1\hfil
  \hb@xt@0\@pnumwidth{\hss #2%}
  \kern-\p@\kern\p@}}\par
```

Prevent a pagebreak immediately after this entry, but use `\everypar` to reset the `\if@nobreak` switch. Finally we close the group.

```
\nobreak
\langle article \rangle
\if@compatibility
  \global@nobreaktrue
  \everypar{\global@nobreakfalse\everypar{}}%
\fi
\endgroup
\fi}
```

This macro formats the entries in the table of contents for chapters. It is very similar to `\l@part`

First we make sure that if a pagebreak should occur, it occurs before this entry. Also a little whitespace is added and a group begun to keep changes local.

```
\newcommand*{\l@chapter}[2]{%
  \ifnum \c@tocdepth >\m@ne
    \addpenalty{-\@highpenalty}%
    \vskip 1.0em \@plus\p@
  \else
    \vskip 0em\relax
  \fi

  \setlength{\@tempdima}{1.5em}%

  \begingroup
    \parindent \z@ \rightskip \@pnumwidth
    \parfillskip -\@pnumwidth
    \leavevmode \bfseries
    \mbox{
      \hbox to \hsize{
        #1\nobreak
        \hfil\nobreak
        \hb@xt@0\@pnumwidth{\hss #2%}
        \kern-\p@\kern\p@}
      \penalty\@highpenalty
    }
  \endgroup
  \fi}
\endgroup
```

The macro `\numberline` requires that the width of the box that holds the part number is stored in `\@tempdima`. Therefore we initialize it there even though we do not use `\numberline` internally (the position as well as the values seems questionable but can’t be changed without producing compatibility problems). We begin a group, and change some of the paragraph parameters (see also the remark at `\l@part` regarding `\rightskip`).

```
\setlength{\@tempdima}{1.5em}%
\begingroup
  \parindent \z@ \rightskip \@pnumwidth
  \parfillskip -\@pnumwidth

  \leavevmode \bfseries
  \mbox{
    \hbox to \hsize{
      \hfill #1\hfil
      \advance\leftskip-\@tempdima
      \hskip -\leftskip
      \nobreak
      \nobreak
      \hb@xt@0\@pnumwidth{\hss #2%}
      \kern-\p@\kern\p@}
    \penalty\@highpenalty
  }
\fi}
```

Then we leave vertical mode and switch to a bold font.

```
\leavevmode \bfseries
```

Because we do not use `\numberline` here, we have do some fine tuning ‘by hand’, before we can set the entry. We discourage but not disallow a pagebreak immediately after a chapter entry.

```
\advance\leftskip-\@tempdima
\hskip -\leftskip
#1\nobreak\hfil
\nobreak\hb@xt@0\@pnumwidth{\hss #2%}
\kern-\p@\kern\p@}\par
```

```
\penalty\@highpenalty
\endgroup
\fi}
```

\end{report}
In the article document class the entry in the table of contents for sections looks much like the chapter entries for the report and book document classes. First we make sure that if a pagebreak should occur, it occurs before this entry. Also a little whitespace is added and a group begun to keep changes local.

\newcommand{\l@section}[2]{%
  \ifnum \c@tocdepth >\z@
    \addpenalty\@secpenalty
    \addvspace{1.0em \@plus\p@}%
  \fi}

The macro \numberline requires that the width of the box that holds the part number is stored in \@tempdima. Therefore we put it there. We begin a group, and change some of the paragraph parameters (see also the remark at \l@part regarding \rightskip).

\setlength{\@tempdima}{1.5em}\
\begingroup
  \parindent \z@ \rightskip \@pnumwidth
  \parfillskip -\@pnumwidth
  Then we leave vertical mode and switch to a bold font.
  \leavevmode \bfseries
  Because we do not use \numberline here, we have do some fine tuning ‘by hand’, before we can set the entry. We discourage but disallow a pagebreak immediately after a chapter entry.
  \advance\leftskip\@tempdima
  #1\nobreak\hfil
  \nobreak\hb@xt@\@pnumwidth{\hss #2\
  \kern-\p@\kern\p@}
\endgroup

In the report and book document classes the definition for \l@section is much simpler.

\newcommand{\l@section}{\@dottedtocline{1}{1.5em}{2.3em}}
\newcommand{\l@subsection}{\@dottedtocline{2}{3.8em}{3.2em}}
\newcommand{\l@subsubsection}{\@dottedtocline{3}{7.0em}{4.1em}}
\newcommand{\l@paragraph}{\@dottedtocline{4}{10em}{5em}}
\newcommand{\l@subparagraph}{\@dottedtocline{5}{12em}{6em}}

All lower level entries are defined using the macro \@dottedtocline (see above).
8.1.2 List of figures
\listoffigures This macro is used to request that \LaTeX{} produces a list of figures. It is very similar to \tableofcontents.

\begin{verbatim}
1225 \newcommand\listoffigures{\% 1226 (*report | book) 1227 \if@twocolumn 1228 \@restonecoltrue\onecolumn 1229 \else 1230 \@restonecolfalse 1231 fi 1232 \chapter*{\listfigurename}\% 1233 \section*{\listfigurename}\% 1234 \@mkboth{\MakeUppercase\listfigurename}{\MakeUppercase\listfigurename}\% 1235 \@starttoc{lof} 1236 \fi}
\end{verbatim}
\listfigure This macro produces an entry in the list of figures.

\begin{verbatim}
1240 \newcommand*{\l@figure}{\@dottedtocline{1}{1.5em}{2.3em}}
\end{verbatim}

8.1.3 List of tables
\listoftables This macro is used to request that \LaTeX{} produces a list of tables. It is very similar to \tableofcontents.

\begin{verbatim}
1241 \newcommand\listoftables{\% 1242 (*report | book) 1243 \if@twocolumn 1244 \@restonecoltrue\onecolumn 1245 \else 1246 \@restonecolfalse 1247 fi 1248 \chapter*{\listtablename}\% 1249 \section*{\listtablename}\% 1250 \@mkboth{\MakeUppercase\listtablename}{\MakeUppercase\listtablename}\% 1251 \@starttoc{lot} 1252 \fi}
\end{verbatim}
\listtable This macro produces an entry in the list of tables.

\begin{verbatim}
1257 \let\l@table\l@figure
\end{verbatim}

8.2 Bibliography
\bibindent The “open” bibliography format uses an indentation of \bibindent.

\begin{verbatim}
49
1258 \newdimen\bibindent
1259 \setlength{\bibindent}{1.5em}
\end{verbatim}
The `thebibliography` environment executes the following commands:

```
\renewcommand\newblock{\hskip.11em \@plus.33em \@minus.07em}
```

— Defines the “closed” format, where the blocks (major units of information) of an entry run together.

```
\sloppy
\sfcode\.'=1000\relax
```

— Used because it’s rather hard to do line breaks in bibliographies, causes a ‘.’ (period) not to produce an end-of-sentence space.

The implementation of this environment is based on the generic list environment. It uses the `enumiv` counter internally to generate the labels of the list.

When an empty `thebibliography` environment is found, a warning is issued.

```
\newenvironment{thebibliography}{\section*{\refname}}{\chapter*{\bibname}}
```

The \texttt{\@mkboth} was moved out of the heading argument since at least in report and book (twocolumn option) there are definitions for \texttt{\chapter} which would swallow it otherwise.

```
\@mkboth{\MakeUppercase\refname}{\MakeUppercase\refname}
\@mkboth{\MakeUppercase\bibname}{\MakeUppercase\bibname}
```

This is setting the normal (non-infinite) value of \texttt{\clubpenalty} for the whole of this environment, so we must reset its stored value also. (Why is there a \texttt{\%} after the second 4000 below?)

```
\clubpenalty4000
\clubpenalty \clubpenalty
\widowpenalty4000
```

```
\@openbib@code
\let\@openbib@code\@empty
```

The default definition for \texttt{\@openbib@code} is to do nothing. It will be changed by the \texttt{openbib} option.

```
\let\@noitemerr\@latex@warning{Empty `thebibliography' environment}\%
```

```
\@biblabel\bibitem{[...]}{[...]}\%
```

The label for a \texttt{\bibitem} [...] command is produced by this macro. The default from \texttt{latex.dtx} is used.

```
\% \renewcommand*{\@biblabel}{[1][#1]\hfill}
```

50
\@cite The output of the \cite command is produced by this macro. The default from \latex\,dtx is used.

\begin{verbatim}
1288 \renewcommand*{\@cite}{\[#1\]}
\end{verbatim}

\section{The index}

\@idxitem The environment ‘theindex’ can be used for indices. It makes an index with two columns, with each entry a separate paragraph. At the user level the commands \item, \subitem and \subsubitem are used to produce index entries of various levels. When a new letter of the alphabet is encountered an amount of \indexspace white space can be added.

\begin{verbatim}
1289 \newenvironment{theindex}
1290 {\if@twocolumn
1291 \@restonecolfalse
1292 \else
1293 \@restonecoltrue
1294 \fi
1295 ⟨article⟩\twocolumn[\section*{\indexname}]%
1296 ⟨!article⟩\twocolumn[\@makeschapterhead{\indexname}]%
1297 \@mkboth{\MakeUppercase\indexname}{\MakeUppercase\indexname}%
1298 \thispagestyle{plain}\parindent\z@}
\begin{verbatim}
1299 \let\item\@idxitem}
\end{verbatim}

\@idxitem These macros are used to format the entries in the index.

\begin{verbatim}
1300 \renewcommand\@idxitem{\par\hangindent 40\p@}
1301 \renewcommand\subitem{\@idxitem \hspace*{20\p@}}
1302 \renewcommand\subsubitem{\@idxitem \hspace*{30\p@}}
\end{verbatim}

\indexspace The amount of white space that is inserted between ‘letter blocks’ in the index.

\begin{verbatim}
1303 \newcommand\indexspace{\par \vskip 10\p@ \@plus 5\p@ \@minus 3\p@\relax}
\end{verbatim}

\subsection{Footnotes}

\footnoterule Usually, footnotes are separated from the main body of the text by a small rule. This rule is drawn by the macro \footnoterule. We have to make sure that the rule takes no vertical space (see plain\,tex) so we compensate for the natural height of the rule of 0.4pt by adding the right amount of vertical skip.

To prevent the rule from colliding with the footnote we first add a little negative vertical skip, then we put the rule and make sure we end up at the same point where we begun this operation.

\begin{verbatim}
1309 \renewcommand\footnoterule{%
\end{verbatim}
Footnotes are numbered within chapters in the report and book document styles.
\footnotetext{Footnotes are numbered within chapters in the report and book document styles.}

\makefntext{The footnote mechanism of \LaTeX{} calls the macro \texttt{\makefntext} to produce the actual footnote. The macro \texttt{\makefntext} is called when effectively inside a \texttt{parbox} of width \texttt{\columnwidth} (i.e., with \texttt{\hsize} = \texttt{\columnwidth}).}

An example of what can be achieved is given by the following piece of \TeX{} code.
\begin{verbatim}
 \newcommand{\makefntext}[1]{% 
 \setpar{\@@par \tempdima = \hsize \advance\tempdima-10pt \parshape \@ne 10pt \tempdima}\par 
 \parindent 1em\noindent 
 \hbox to \z@{\hss\@makefnmark}#1}
\end{verbatim}

The effect of this definition is that all lines of the footnote are indented by 10pt, while the first line of a new paragraph is indented by 1em. To change these dimensions, just substitute the desired value for ‘10pt’ (in both places) or ‘1em’. The mark is flushright against the footnote.

In these document classes we use a simpler macro, in which the footnote text is set like an ordinary text paragraph, with no indentation except on the first line of a paragraph, and the first line of the footnote. Thus, all the macro must do is set \parindent to the appropriate value for succeeding paragraphs and put the proper indentation before the mark.
\begin{verbatim}
 \newcommand{\makefntext}[1]{% 
 \parindent 1em\noindent 
 \hbox to \z@{\hss\@makefnmark}\#1}
\end{verbatim}

The footnote markers that are printed in the text to point to the footnotes should be produced by the macro \texttt{\makefntext}. We use the default definition for it.
\begin{verbatim}
 %\renewcommand{\makefntext}{\hbox{\@textsuperscript{1}\@thefnmark}}
\end{verbatim}

\section{Initialization}
\subsection{Words}
This document class is for documents prepared in the English language. To prepare a version for another language, various English words must be replaced. All the English words that require replacement are defined below in command names. These commands may be redefined in any class or package that is customising \LaTeX{} for use with non-English languages.
\newcommand{\today}{
    \ifcase\month
        January\or February\or March\or April\or May\or June\or
        July\or August\or September\or October\or November\or December\fi
    \space\number\day, \number\year}

9.3 Two column mode
\columnsep
This gives the distance between two columns in two column mode.
\setlength{\columnsep}{10\p@}
\columnseprule
This gives the width of the rule between two columns in two column mode. We have no visible rule.
\setlength{\columnseprule}{0\p@}

9.4 The page style
We have \textit{plain} pages in the document classes article and report unless the user specified otherwise. In the ‘book’ document class we use the page style \textit{headings} by default. We use arabic pagenumbers.
\begin{itemize}
    \item \texttt{\{book\} pagestyle\{plain\}}
    \item \texttt{\{book\} pagestyle\{headings\}}
    \item \texttt{\{book\} pagening\{arabic\}}
\end{itemize}
9.5 Single or double sided printing

When the `twoside` option wasn’t specified, we don’t try to make each page as long as all the others.

```
\if@twoside
\else
\raggedbottom
\fi
```

When the `twocolumn` option was specified we call `\twocolumn` to activate this mode. We try to make each column as long as the others, but call \texttt{sloppy} to make our life easier.

```
\if@twocolumn
\twocolumn
\sloppy
\flushbottom
\else
\onecolumn
\fi
```

Normally we call `\onecolumn` to initiate typesetting in one column.

```
\else
\onecolumn
\fi
```

```
\end{document}
```

Index

Numbers written in italic refer to the page where the corresponding entry is described; numbers underlined refer to the code line of the definition; numbers in roman refer to the code lines where the entry is used.
